Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

BROWNFIELDS: Completed Brownfields Covenants Listing

Under Massachusetts law, M.G.L. c. 21E is the statute that governs the cleanup of releases of oil and/or hazardous material to the environment. The Brownfields Act of 1998 amended M.G.L. c. 21E by establishing significant liability relief and financial incentives to spur the redevelopment of brownfields, while ensuring that the Commonwealth's environmental standards are met. Most brownfields are redeveloped with the benefit of liability protections that operate automatically under M.G.L. c. 21E.

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

These keywords were tested to maximize accuracy in selecting facilities that may use fire-fighting foam in training exercises, however, due to the lack of a required reporting field in the data systems for designating fire training sites, this methodology may not identify all fire training sites or may potentially misidentify them.

PFAS PART 139 AIRPORT: All Certified Part 139 Airports PFAS Information Listing

Since July 1, 2006, all certified part 139 airports are required to have fire-fighting foam onsite that meet military specifications (MIL-F-24385) (14 CFR 139.317). To date, these military specification fire-fighting foams are fluorinated and have been historically used for training and extinguishing. The 2018 FAA Reauthorization Act has a provision stating that no later than October 2021, FAA shall not require the use of fluorinated AFFF. This provision does not prohibit the use of fluorinated AFFF at Part 139 civilian airports; it only prohibits FAA from mandating its use. The Federal Aviation Administration?s document AC 150/5210-6D - Aircraft Fire Extinguishing Agents provides guidance on Aircraft Fire Extinguishing Agents, which includes Aqueous Film Forming Foam (AFFF).

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

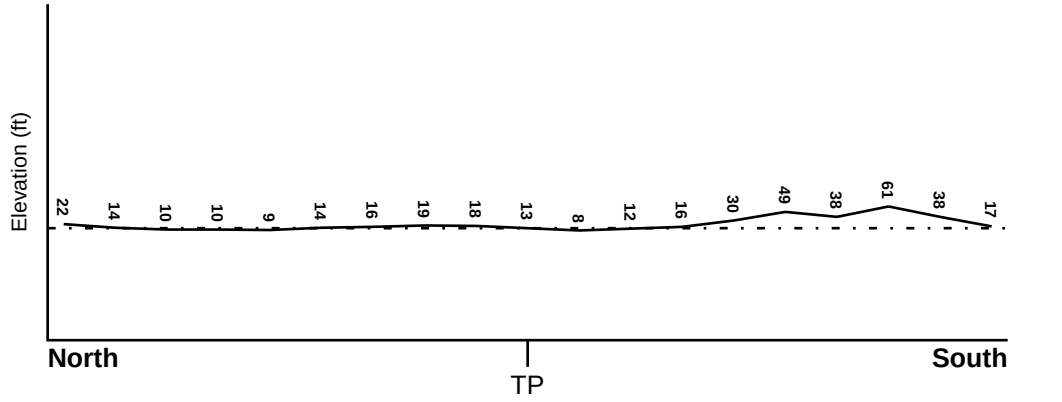
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

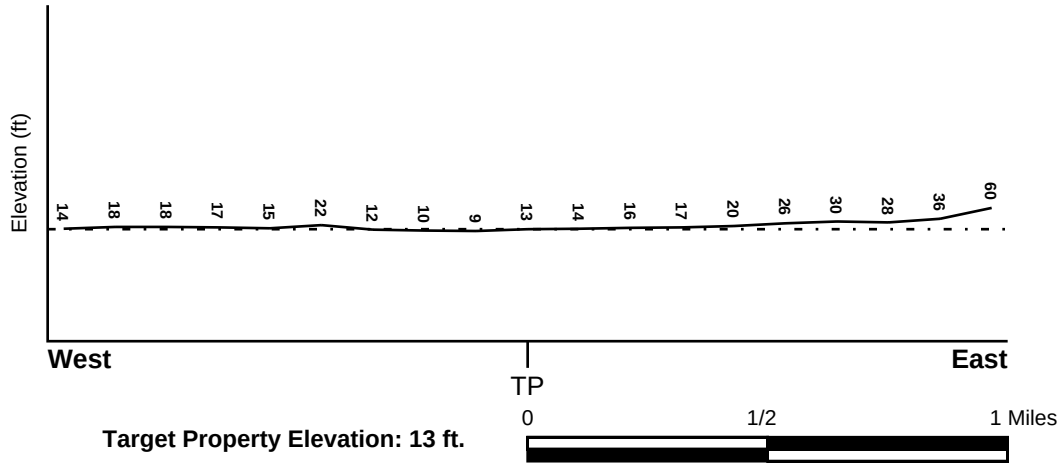
GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION



Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Target Property Elevation: 13 ft.

0 1/2 1 Miles

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

Public Water Supply Database

The Public Water Supply datalayer contains the locations of public community surface and groundwater supply sources and public non-community supply sources as defined in 310 CMR 22.00.

Areas of Critical Environmental Concern

Telephone:
The Areas of Critical Environmental Concern (ACEC) datalayer shows the location of areas that have been designated ACECs by the Secretary of Environmental Affairs. ACEC designation requires greater environmental review of certain kinds of proposed development under state jurisdiction within the ACEC boundaries. The ACEC Program is administered by the Department of Environmental Management (DEM) on behalf of the Secretary of Environmental Affairs. The Massachusetts Coastal Zone Management (MCZM) Office managed the original Coastal ACEC Program from 1978 to 1993, and continues to play a key role in monitoring coastal ACECs. Procedures for ACEC designation and the general policies governing the effects of designation are contained in the ACEC regulations (301 CMR 12.00). The ACEC datalayer has been compiled by MCZM and DEM and includes both coastal and inland areas.

EPA Designated Sole Source Aquifers

Telephone:
The Sole Source Aquifer datalayer was compiled by the Department of Environmental Protection (DEP) Division of Water Supply (DWS). Seven Sole Source Aquifers have been designated by the US Environmental Protection Agency (EPA) for Massachusetts. A Sole Source Aquifer (SSA) is an aquifer designated by US EPA as the sole or principal source of drinking water for a given aquifer service area; that is, an aquifer which is needed to supply 50% or more of the drinking water for that area and for which there are no reasonably available alternative sources should that aquifer become contaminated. The aquifers were defined by an EPA hydrogeologist.

Aquifers

Telephone:
MassGIS produced an aquifer datalayer composed of 20 individual panels, generally based on the boundaries of the major drainage basins. Areas of high and medium yield were mapped. This datalayer includes polygon attribute coding to help in the identification of areas in which cleanup of hazardous waste sites must meet drinking water standards, as defined in the Massachusetts Contingency Plan (MCP) (310 CMR 40.00000).

Non-Potential Drinking Water Source Areas

Telephone:
Non-Potential Drinking Water Source Areas (NPDWSA) are regulatory in nature representing one of many considerations used in determining the standards to which ground water must be cleaned in the event of a release of oil or hazardous material. NPDWSAs are not based on existing water quality and do not indicate poor ambient conditions.

DEP Approved Zone IIs

Telephone:
The Department of Environmental Protection (DEP) approved Zone IIs datalayer was compiled by the DEP Division of Water Supply (DWS). The database contains 281 approved Zone IIs statewide. As stated in 310 CMR 22.02, a Zone II is 'that area of an aquifer which contributes water to a well under the most severe pumping and recharge conditions that can be realistically anticipated (180 days of pumping at safe yield, with no recharge from precipitation.) It is bounded by the groundwater divides which result from pumping the well and by the contact of the aquifer with less permeable materials such as till or bedrock. In some cases, streams or lakes may act as recharge boundaries. In all cases, Zone IIs shall extend up gradient to its point of intersection with prevailing hydrogeologic boundaries (a groundwater flow divide, a contact with till or bedrock, or a recharge boundary).' These data are used in association with the Public Water Supplies datalayer. The following describes certain unique features of this association.\n - Any proposed new well which will pump at least 100,000 gallons per day must have a Zone II delineation completed and approved by DEP prior to the well coming on line. \n- Additionally, a new source may not be on-line yet, but other, older wells may fall within its Zone II boundary.\n - Further, existing wells must have a Zone II delineated as a condition of receiving a water withdrawal permit under the Water Management Act.

The following sections are quoted directly from 453 CMR 6 of Department of Labor.

If, in order to correct a violation the owner chooses to remove asbestos material, the owner shall submit an asbestos removal plan to the board of health. The plan shall include a description of the locations, nature, scope and method of removal, measures that will be taken to prevent the escape of asbestos material and to protect persons engaged in the removal work, the place and method of disposal of asbestos material, and the name of the remover (if other than owner). No removal work shall commence before the removal plan has been approved by the board of health. During any removal work:

1. Asbestos material shall be thoroughly wetted so as to prevent the release of any dust emissions.

2. Asbestos material which has been removed shall be kept thoroughly wetted until it has been disposed of in a disposal facility approved by the Department of Environmental Quality Engineering or until it has been sealed in leak-proof containers which will be disposed of unopened in a disposal facility approved by the Department of Environmental Quality Engineering.

3. Access to areas in which asbestos removal work is taking place shall be limited to persons actually engaged in or supervising such work and to representatives of the board of health or other governmental agencies authorized by law to enter the premises.

4. Areas in which asbestos removal work is taking place shall be sealed to prevent the release of asbestos dust and powdered, crumbled, or pulverized asbestos material into other parts of the building or to the outdoors. Such sealing may be accomplished by taping cracks around doors and windows, and using an impervious material such as polyethylene sheeting to seal areas which cannot be sealed by closing and taping doors and windows.

5. Person(s) working, supervising or inspecting within an area in which asbestos material is being removed shall wear respirators approved by the National Institute for Occupational Safety and Health as safe for the concentration of asbestos dust present.

6. Person(s) working, supervising or inspecting within an area in which asbestos is being removed shall wear either disposable overalls or outer garments which will be stored until laundered seperately from other clothing.

7. All pieces of furniture, equipment and other items in the work area which can be readily moved shall be removed from the work area prior to commencing asbestos removal work. Items that can not be readily moved, and from which it will be difficult to clean asbestos dust after removal work, shall be covered and sealed with impervious material such as polyethylene sheeting tape.

8. A sign(s) shall be placed out side each entrance to the work area. Such sign(s) shall state "Warning Asbestos Work in Progress-Authorized Persons Only".

9. No asbestos material shall be dropped or thrown from one story to lower story.

10. After removal work, the work area shall be throughly cleaned of remaining asbestos material and asbestos dust. If a vacuum cleaner is used, it shall only be one which is rated for asbestos dust. All surfaces in the work area shall be wet-wiped or wet-mopped sufficiently to remove remaining asbestos dust.

11. Following the cleanup required by 453 CMR 6.14 the facility owner or asbestos contractor conducting the asbestos response action shall submit a Clean Air report to Inspectional Services Department when finished.

Re: 41 Bellis Circle / Cambridge, Ma.

Bob,

This proposal is submitted in accordance with your invitation to provide a quotation for the abatement, encapsulation and the disposal of the asbestos containing building materials as identified in the field drawings provided by Mr. Robert Najarian. The undersigned, having carefully examined the site where the proposed work is to be performed, and having become familiar by the investigation of the conditions which may effect the work, agrees to furnish all materials, labor and equipment, to complete the abatement work to your satisfaction.

SCOPE OF WORK

The scope of work will include the abatement, decontamination and the disposal of all asbestos containing building materials as identified in the asbestos survey completed by Cesar Orandella of ATS and confirmed by Sam Homsey of A-Best Abatement Inc. Work will be completed in 1 shift and the material will be removed by method of "full containment" . All state and federal guidelines will be strictly adhered to when abatement work is conducted. In addition, all of the above work will be completed by sealing all criticals barriers, including entrances (when applicable) and egresses. All methods will be acceptable to the state of MA DEP.

SPECIAL CONDITIONS

Owner to provide the following:

*Supply all electrical requirements
*Supply all water requirements for abatement work.
*Area must be accessible to A-Best Abatement Inc. without the interruption of other trades

CLOSE OUT DOCUMENTATION

Upon completion of the specified work, documentation for the completed project will be submitted to the owner. This documentation is a crucial element for the assurance against any legal entanglement or litigation if and when the property is ever sold. This comprehensive package is a standard service provided by A-Best Abatement Inc. that ensures the total completion of the contracted work.

PRICE

A-Best carries 5 million in general aggregate asbestos specific insurance as well as the required statutory worker's compensation insurance.

The price for the completion of the above work including all necessary notification fees as well as all applicable disposal costs and air testing will be: **TWO THOUSAND FIVE HUNDRED DOLLARS ($2,750.00).**

TERMS

Re: Building Demolition, 41 Bellis Circle, Cambridge, Ma.

Mike, please note the following narrative on the proposed building demolition at #41 Bellis Circle in accordance with the permit application requirements.

The demolition process will include:

1. Temporary Fencing will be constructed around the building inside the parking lot and along the Bellis Circle side of the building

2. The building footprint is approximately 15' x 30', single story, wood framing for the first floor and roof, with red brick perimeter walls. There is a full basement. The roof was replaced within the last few years and is EPDM over plywood. The original wood tongue & groove decking appears to be inplace

3. Access to the inside of the building is restricted due to a partial collapse of the first floor.

4. Cam's Demolition of Wilmington will take down the building. The debris will be loaded into roll off 30yard waste dumpsters, covered inside the temporary fenced area and transported off site. It is expected that (1) dumpster will be required for masonry and (1) for wood.

5. Asbestos Abatement: As noted in the attached report there is an old boiler in the basement which has tested positive for asbestos. The plan would be to take the building down to the top of foundation. Encapsulate the boiler for " full containment", bring it to grade level to allow the asbestos removal company to complete their work. There is a pile of old floor tile in the basement, which has tested positive for asbestos, and will be removed at this time as well.

6. Asbestos Contractor(s): This work will be performed by either ASAP out of Plaistow, NH or A-Best Abatement out of Salem, NH.

7. Air Quality Testing: To be conducted by A.T.S., Inc, from West Newbury,Ma. Please note that A.T.S. also conducted the on site inspection and testing as noted in the attached report.

8. D.P.W. Inspection: The existence of a sewer feed to the building cannot be determined at this time due to the unsafe conditions noted above. The D.P.W. has agree to send a field inspector to the site when the foundation can be safely accessed. If a sewer feed is still in service then it will be removed and capped per their instruction.

9. PLUMBING/GAS & ELECTRICAL: NStar has confirmed that there is no gas or electrical service to the building.

10. WATER: C.W.D. has confirmed that there is no water service to the building. We have assumed therefore that all existing plumbing fixtures were disconnected years ago.

11. The foundation will be removed once the construction debris has been removed

12. After the foundation is removed the excavation will be filled with gravel and top coated with asphalt.

13. The hydrant at Sherman Street will be used to control dust during the demolition process. If not then a water trailer will be rented from United Rentals for the same purpose.

PROJECT SCOPE: Inspection and Survey for Suspect Asbestos Building Materials to Facilitate Building Demolition.

SURVEY LIMITATIONS

This Asbestos Survey was conducted with the intent that all suspect asbestos building materials be discovered as best as could be expected without actual demolition of the buildings. Many walls, ceilings, and floors were opened up (broken open) during the survey to discover the nature of construction and materials used. It is recommended that during Asbestos Abatement and or Renovation / Demolition an Onsite Asbestos Inspector be present to ensure that if any undiscovered suspect asbestos building materials arise, they be addressed appropriately. ATS is not responsible for inaccessible or hidden building materials. This survey did not include: Soils, Underground Utilities, Drainage Systems, Inaccessible Spaces, Inaccessible Crawl Spaces, & Inaccessible Foundations.

Only a State Licensed Asbestos Abatement & Disposal Company is Permitted to Remove & Dispose Asbestos Containing Materials.

Please feel free to contact me with any questions or for clarifications.

Sincerely,

Caesar Orlandella, Asbestos Inspector

ASTM E1527-21
Phase I Environmental Site Assessment
User Questionnaire

INTRODUCTION

In order to qualify for one of the *Landowner Liability Protections (LLPs)*[1] offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "*Brownfields Amendments*"),[2] the *user* must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. These inquiries must also be conducted by EPA Brownfield Assessment and Characterization grantees. The *user* should provide the following information to the *environmental professional*. Failure to conduct these inquiries could result in a determination that "*all appropriate inquiries*" is not complete.

(1.) Environmental liens that are filed or recorded against the *property* (40 CFR 312.25).

Did a search of *recorded land title records* (or judicial records where appropriate, see *Note 1* below) identify any environmental liens filed or recorded against the *property* under federal, tribal, state or local law?

I am not aware of any environmental liens.

Note 1—In certain jurisdictions, federal, tribal, state, or local statutes, or regulations specify that environmental liens and AULs be filed in judicial records rather than in land title records. In such cases judicial records must be searched for environmental liens and AULs.

(2.) Activity and use limitations that are in place on the *property* or that have been filed or recorded against the *property* (40 CFR 312.26(a)(1)(v) and vi)).

Did a search of *recorded land title records* (or judicial records where appropriate, see *Note 1* above) identify any AULs, such as *engineering controls*, land use restrictions or *institutional controls* that are in place at the *property* and/or have been filed or recorded against the *property* under federal, tribal, state or local law?

I am not aware of any AULs.

(3.) Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).

Do you have any specialized knowledge or experience related to the *property* or nearby properties? For example, are you involved in the same line of business as the current or former *occupants* of the *property* or an *adjoining property* so that you would have specialized knowledge of the chemicals and processes used by this type of business?

No

[1] *Landowner Liability Protections*, or *LLPs*, is the term used to describe the three types of potential defenses to Superfund liability in EPA's *Interim Guidance Regarding Criteria Landowners Must Meet in Order to Qualify for Bona Fide Prospective Purchaser, Contiguous Property Owner, or Innocent Landowner Limitations on CERCLA Liability* ("*Common Elements*" Guide) issued on March 6, 2003.
[2] P.L. 107-118.

(4.) Relationship of the purchase price to the fair market value of the *property* if it were not contaminated (40 CFR 312.29).

Does the purchase price being paid for this *property* reasonably reflect the fair market value of the *property*? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the *property*?

The appraisal considered fair market value.

(5.) Commonly known or *reasonably ascertainable* information about the *property* (40 CFR 312.30).

Are you aware of commonly known or *reasonably ascertainable* information about the *property* that would help the *environmental professional* to identify conditions indicative of releases or threatened releases?

RAM Plan for petroleum impacted soils was implemented in 2016. I am not aware of any other information regarding releases on the site.

For example,

(a.) Do you know the past uses of the *property*?

(b.) Do you know of specific chemicals that are present or once were present at the *property*?

(c.) Do you know of spills or other chemical releases that have taken place at the *property*?

(d.) Do you know of any environmental cleanups that have taken place at the *property*?

(6.) The degree of obviousness of the presence or likely presence of contamination at the *property*, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).

Based on your knowledge and experience related to the *property* are there any *obvious* indicators that point to the presence or likely presence of releases at the *property*?

I am not.

In addition, certain information should be collected, if available, and provided to the *environmental professional* conducting the *Phase I Environmental Site Assessment*. This information is intended to assist the *environmental professional*, but is not necessarily required to qualify for one of the *LLPs*. The information includes:

(a) the reason why the Phase I is being performed,

The Phase 1 is being requested to help provide information about the parcel before the city acquires it.

(b) the type of *property* and type of *property* transaction, for example, sale, purchase, exchange, etc.,

Current parking lot that the City is looking to purchase for municipal uses.

(c) the complete and correct address for the *property* (a map or other documentation showing *property* location and boundaries is helpful),

41 Bellis Circle

(d) the scope of services desired for the Phase I ESA (including whether any parties to the *property* transaction may have a required standard scope of services or whether any considerations beyond the requirements of Practice E1527 are to be considered),

(e) identification of all parties who will rely on the Phase I *report*,

The City of Cambridge.

(f) identification of the site contact and how the contact can be reached,

Katherine Watkins, kwatkins@cambridgema.gov / 617-349-4751

(g) any special terms and conditions which must be agreed upon by the *environmental professional*, and

(h) any other knowledge or experience with the *property* that may be pertinent to the *environmental professional* (for example, copies of any available prior *environmental site assessment reports*, documents, correspondence, etc., concerning the *property* and its environmental condition).

Permanent Solution with No Conditions Statement and

Release Abatement Measure Completion Report

In accordance with the Massachusetts Contingency Plan (MCP), 310 CMR 40.0000, EBI Consulting (EBI) has prepared this Permanent Solution (PS) with No Conditions Statement (PSS) and Release Abatement Measure (RAM) Completion Statement on behalf of Bellis Circle, Inc. (Bellis Circle). This report applies to the property located at 41 Bellis Circle in Cambridge, Massachusetts (the Site) and is associated with the Release Tracking Number (RTN) 3-33725. The content of this report has been structured to address the specific requirements set forth in both 310 CMR 40.1000 and 40.0446. This document is being submitted electronically through the MassDEP's eDEP website in conjunction with the MassDEP Bureau of Waste Site Cleanup (BWSC) transmittal forms BWSC-104 and BWSC-106 for a PSS and RAM Completion Statement, respectively.

1.0 INTRODUCTION

The RTN 3-33725 was generated as a result of a 120-day reporting condition identified during subsurface investigations at the Site in June and July 2016. The reporting condition was based on the detection of extractable petroleum hydrocarbons (EPH) and volatile petroleum hydrocarbons (VPH) in soil sampling above MCP Reporting Category RCS-1 standards. Concentrations of EPH and VPH were detected above laboratory detection limits in the groundwater samples collected at the Site, but below applicable MCP Reporting Category RCGW-2 standards.

Remedial actions in the form of soil excavation and off-site disposal were completed at the Site as a RAM and post-excavation soil samples were submitted for laboratory analyses. Based upon a Method 1 Risk Characterization performed using the post-excavation sample data, residual concentrations of petroleum constituents in soil at the Site are below applicable Method 1 S-1 standards and constitute a condition of No Significant Risk. Therefore a Permanent Solution with No Conditions is appropriate for the Disposal Site.

The current Site owner and party conducting response actions is:

Additionally, this report provides the documentation to satisfy the requirements of a RAM Completion Statement.

2.0 SITE DESCRIPTION

2.1 Location/Layout

2.1.1 Geographic Location

The Site is located in the northwestern quadrant of the intersection of Sherman Street and Bellis Circles and south of the Massachusetts Bay Transportation Authority (MBTA) Commuter Rail Line (Figure 1 – Site Location Map). Figure 2 depicts the Site on a USGS topographic map. Figure 3, depicts soil and groundwater sampling locations. Figure 4 depicts the Disposal Site Boundary along with relevant post-excavation soil and groundwater sampling locations. Figure 5 is a Relative Groundwater Elevation Map. Figure 6 is the MassDEP Priority Resource/Phase I Map. The Universal Transverse Mercator (UTM) coordinates for the Site are 4695343 meters north and 324399 meters east, in Zone 19.

2.1.2 Site Description

According to information provided in previous reports prepared for the Site, the Site is zoned for Residential use (C-1A) which indicates acceptable uses as single and two-family dwellings, townhouse dwellings, multifamily dwellings and some institutional uses. The Site property is comprised of a 40,383 square foot parcel of land improved with an asphalt paved parking surface which is leased by the Montessori School and Jose's Mexican Restaurant.

The Site is located within an area primarily consisting of residential properties. The immediate vicinity of the Site consists of residential single-family homes, multifamily apartment buildings and commercial development.

2.1.3 Area Characteristics

North: The Site is bound to the north by railroad tracks owned and operated by the Massachusetts Bay Transportation Authority (MBTA), followed by a commercial building (147 Sherman Street).

South: The Site is bound to the south by Bellis Circle, followed by several residential properties (40, 44, 54, 56 Bellis Circle), the Montessori School (129 Sherman Street) and Jose's Mexican Restaurant (131 Sherman Street).

East: The Site is bound to the east by Sherman Street, followed by a residential apartment building (61 Bolton Street). The Site is bound to the northeast by a mixed-use property (140 Sherman Street) that includes a residence and automotive repair facility known as the North Cambridge Garage. The Site is bound to the southeast by an apartment building (132 Sherman Street).

West: The Site is bound to the west by multi-family building (39 Bellis Circle) and Thomas Danehy Park.

The nearest residential properties are located across Bellis Circle to the south and west and across Sherman Street to the east. Potential human receptors determined for this Site are construction and utility workers and adult and child visitors to the Site. Currently, residual impacts to soil are located beneath the landscaped area between the paved Bellis Circle right-of-way and the paved parking lot at depths greater than 7-feet below grade.

A Priority Resource/Phase I Map (Figure 6) identifies regional environmental information and the locations of potential environmental receptors. The map was created using the Massachusetts Office of Geographic Information System (MassGIS) online mapping tool. According to the map, the Site is not located within

a MassDEP approved Zone II, Interim Wellhead Protection Area (IWPA), Zone A of a Class A surface water body, or a Potential Drinking Water Source Area. No private drinking water wells are located within 500 feet of the Site.

It should be noted that the boundaries of a solid waste landfill, identified as the New Street Landfill, are located within 500 feet of the Site (West and south). The Site is located hydraulically crossgradient to upgradient of the solid waste landfill. Additionally, reported local groundwater flow direction at the Site is to the southwest.

The Montessori School occupies an adjacent parcel to the south located across Bellis Circle (129 Sherman Street). The private elementary school building footprint is located approximately 50-feet south of the Site's southern property boundary, and in the downgradient direction.

2.2 Site History

2.2.1 Property Usage History

Based upon review of previously prepared documents and historic site use information, the Site was developed with the West Cambridge Depot, including two railroad spurs as early as 1900 until 1934. By 1935, the Site had been redeveloped with a Diamond Coal Company and consisted of coal storage areas and a small office. Site representatives indicate that heating oil was also sold as part of the Diamond Coal Company operations. The Diamond Coal Company reported operated until the late 1960's. The buildings were removed and the property remained vacant land and/or a surface parking lot to the present-day. Site representatives indicated that any remaining USTs were removed from the ground in the early 1980's.

According to a 1961 survey of the Site, a "gas pump" was located on the approximate central portion of the southern property boundary. However, the location of the UST(s) and/or AST(s) associated with the gas pump was not depicted. Additionally, a 1950 fire insurance map identifies an area on the Site containing a field "oil tank" in the approximate center of the eastern portion of the Site. The fire insurance map does not specify whether the tank is an aboveground or underground tank and the tank. This area was excavated during implementation of the RAM and UST(s) were not discovered during extensive soil excavation.

2.2.2 Release History

RTN 3-33725

In June 2016, EBI conducted a Limited Subsurface Assessment at the Site which is summarized in a Phase II Environmental Site Assessment report dated June 30, 2016. According to the analytical results, concentrations of EPH and VPH were detected in the soil sample collected from EB-03 (5-10') above MCP Reporting Category RCS-1 standards. In particular, C_9-C_{18} aliphatic hydrocarbons (10,000 mg/kg), C_{11}-C_{22} aromatic hydrocarbons (3,300 mg/kg), C_9-C_{10} aromatic hydrocarbons (470 mg/kg), 2-methylnaphthalene (31 mg/kg) and naphthalene (13 mg/kg) all exceeded MCP Reporting Category RCS-1 standards. Concentrations of EPH, VPH and VOCs were detected above laboratory detection limits in groundwater at the Site, but below applicable MCP Reporting Category RCGW-2 standards.

The Limited Subsurface Assessment also included a Ground Penetrating Radar (GPR) survey of all accessible areas of the Site. Results of the GPR survey did not identify the presence of anomalies indicative of remaining UST(s) at the Site.

In July 2016, EBI conducted an additional subsurface assessment at the Site which is summarized in a Supplemental Phase II Environmental Site Assessment report dated July 19, 2016. The objective of the investigation was to delineate EPH and VPH impacts to soil and further evaluate onsite groundwater conditions. Soil borings were advanced an all four lateral directions around the location of previously identified EPH/VPH petroleum impacts to soil (EB-03). Soil samples collected from three of the six

additional boring locations contained concentrations of EPH and VPH (aliphatic and aromatic hydrocarbons) in soil in excess of MCP Reporting Category RCS-1 and Method 1 S-1/GW-2 standards. The predominant compounds detected in soil are aromatic and aliphatic hydrocarbons, which indicated that the source of the release is likely a fuel oil product. Groundwater samples were collected from five of the six borings locations. Concentrations of EPH and VPH were detected above laboratory detection limits in the additional groundwater samples collected at the Site, but below applicable MCP Reporting Category RCGW-2 standards.

Benzo(a) anthracene, benzo(a)pyrene, benzo(b)flouroanthene, dibenz(a,h)anthracene and indeno(1,2,3-CD) pyrene are pyrogenic compounds that are commonly associated with the presence of coal and/or coal ash in urban/historic fill materials. The compounds were detected in excess of MCP Reporting Category RCS-1 standards in several soil samples collected from the Site. Field observations made by EBI personnel indicated visible urban/historic fill material containing coal and/or coal ash in soil samples collected from borings where the pyrogenic compounds were detected. Based on the observed historic fill containing coal and/or coal ash, the pyrogenic EPH compounds noted above are likely derived from the presence of these fill materials and are exempt from release notification under the MCP pursuant to 310 CMR 40.0317(9).

The release of EPH and VPH aliphatic and aromatic hydrocarbons along with naphthalene and 2-methylnaphthalene was reported to MassDEP using a 120-Day Release Notification Form (RNF) that was submitted to using the e-DEP system on August 1, 2016. RTN 3-33725 was assigned to the release.

3.0 SUMMARY OF RESPONSE ACTIONS

EBI submitted a Release Abatement Measure (RAM) Plan dated August 8, 2016 for the removal and off-Site disposal of petroleum-impacted soil. The objective of the RAM was to remove petroleum impacted soils and collect confirmatory soil samples to support Site closure under the MCP.

3.1 Soil Excavation and Field Screening

On August 22, 2016, EBI and Boston Green mobilized at the Site with the objective of removing petroleum impacted soils via excavation and offsite disposal. Prior to the commencement of excavation activities, the entire perimeter of the work area was secured with a 6-foot chain link fence.

An area of asphalt approximately 60'x60' was removed from the parking surface and stockpiled for off-Site recycling. Following asphalt removal, excavation of petroleum-impacted soil was performed by Boston Green and overseen by EBI between August 22 through September 2, 2016. Soils were excavated from locations of known petroleum impacts, as evidenced by prior sampling, and stockpiled on 6-mil polyethylene.

During excavation activities, EBI personnel performed visual, olfactory, and field screening utilizing a photoionization detector (PID) to evaluate the extent of necessary excavation and the presence or absence of volatile organic compounds (VOCs). The PID was calibrated with an isobutylene standard, to measure total VOCs as isobutylene equivalents. The soil samples were field screened in accordance with MassDEP Policy No. WSC-94-400, Jar Headspace Analytical Screening Procedure.

PID readings ranged from 0.7 to 257 parts per million by volume (ppmv) in post-excavation soil samples. The excavation encompassed approximately 5,390 square feet and the excavation depths ranged from twelve (12) to eighteen (18) feet bgs. Generally, the excavation depth ranged from thirteen (13) to fifteen (15) feet bgs in most locations. Excavation depth was dictated by the depth to clay soils which acted as a barrier to vertical migration of the petroleum hydrocarbons.

Fence-line ambient air PID readings were collected regularly during the course of excavation and soil removal activities. PID readings were collected from both upwind and downwind locations to evaluate local air quality. Generally, PID readings were detected at background levels (0.0 ppm). However, during truck loading proximal to Sherman Street, PID readings as high as 1.6 ppm were observed along the Site's eastern border with Sherman Street. To minimize localized odor and ambient air VOC concentrations, the soil stockpile was covered with polyethylene sheeting during extended waiting periods between truck loads.

3.2 Post Excavation Soil Sampling

During the course of excavation, EBI collected a total of twenty-one (21) confirmatory samples from the excavation bottom and sidewalls for laboratory analysis for EPH via the MassDEP EPH Test Method and VPH via the MassDEP VPH Test Method. The samples were submitted under Chain of Custody documentation to Con-Test Analytical Laboratories (Con-Test of East Longmeadow, Massachusetts) for analysis. A summary of the soil analytical results is attached as Table 1. Soil sampling locations are shown on Figure 4. Laboratory analytical reports are included in Appendix B.

The post-excavation analytical results revealed concentrations of EPH (C_9-C_{18} aliphatics) and VPH (C_9-C_{10} aromatics) above Method 1 S-1/GW-2 and S-1/GW-3 soil standards along the western, southern and eastern excavation sidewalls in four (4) of the twenty-one (21) samples collected. Samples collected along the northern wall of the Disposal Site Boundary did not indicate concentrations of EPH or VPH above Method 1 standards. None of the samples collected from the excavation bottom contained concentrations of EPH or VPH above laboratory method detection limits.

Western Sidewall

The concentration of C_9-C_{10} aromatic hydrocarbons in sample S-9 (110 mg/kg) slightly exceeded its Method 1 S-1/GW-2 and S-1/GW-3 soil standard (100 mg/kg) in S-9 collected at a depth of 7.5-8 feet bgs along the central portion of the western wall. Sample S-9 was collected from a narrow zone (6-inches) of petroleum impacted soil left in place along the western wall. Samples S-8 and S-10 were collected from just above (7-7.5 feet bgs) and just below (8-9 feet bgs) the zone of impacted soils and did not reveal concentrations of EPH or VPH above laboratory method detection limits. These data indicate that the petroleum impacted soil represented by Sample S-9 is a relatively localized condition. Because the detected concentration in S-9 only slightly exceeded its S-1 standard, the benefits of additional remedial actions along the western sidewall to further reduce these concentrations were considered infeasible.

Southern Sidewall

Sample S-11 contained concentrations of C_9-C_{18} aliphatic hydrocarbons (2,100 mg/kg) and C_9-C_{10} aromatic hydrocarbons (310 mg/kg) above Method 1 S-1/GW-2 and S-1/GW-3 soil standards (1,000 and 100 mg/kg, respectively) for these hydrocarbon ranges. Sample S-11 was collected at a depth of 7-11 feet bgs along the central portion of the southern wall. Sample S-12 was collected approximately 9-feet east of S-11 at a depth of 12 feet bgs and did not contain concentrations of EPH or VPH above laboratory method detection limits.

C_9-C_{10} aromatic hydrocarbons (170 mg/kg) were detected in sample S-27 above the Method 1 S-1/GW-2 and S-1/GW-3 soil standard of 100 mg/kg. Sample S-27 was collected at a depth of 9 feet bgs along the eastern portion of the southern wall. Sample S-26 was collected above S-27 at a depth of 7 feet bgs and revealed low concentrations of EPH and VPH above laboratory method detection limits, but below Method 1 S-1/GW-2 and S-1/GW-2 soil standards. The southern sidewall was excavated to the extent practical considering site logistics and proximity to Bellis Circle. The excavation could not be extended further without undermining the adjacent roadway, utility poles and subsurface utilities. Based on the presence of residences and a school located across Bellis Circle to the south, additional soil samples were

collected south of the excavation during the post-excavation soil boring program discussed in Sections 3.5 and 4.2.

Eastern Sidewall

C_9-C_{18} aliphatic hydrocarbons (1,200 mg/kg) and C_9-C_{10} aromatic hydrocarbons (460 mg/kg) exceeded Method 1 S-1/GW-2 and S-1/GW-3 soil standards (1,000 and 100 mg/kg, respectively) in sample S-29 collected at a depth of 7-9 feet bgs along the central portion of the eastern wall. S-29 was collected from a narrow 2-foot zone of petroleum impacted soil left in place along the eastern wall, as evidenced by samples S-28 and S-30, collected from just above (6-7 feet bgs) and just below (10-12 feet bgs) the area of impacted soils. Both S-28 and S-30 did not reveal concentrations of EPH or VPH above laboratory method detection limits. These data indicate that the petroleum impacted soil represented by Sample S-29 is a relatively localized condition. The benefits of additional remedial actions along the eastern sidewall to further reduce the detected concentrations were considered infeasible (see Section 7.0).

3.3 Management of Remediation Waste

Petroleum impacted soils were loaded into dump trailers owned and operated by Sam's Transportation of Georgetown, Massachusetts. Between August 23, 2016 and September 6, 2016, a total of 2,892.76 tons of contaminated soil were transported under Bill of Lading documentation for off-Site recycling at Aggregate Recycling Corporation (ARC) in Eliot, Maine.

Initial soil disposal characterization sampling was performed during the July 2016 drilling program. During the course of excavation, five (5) additional composite stockpile samples were collected for RCRA 8 metals analysis. The RCRA 8 samples were collected to meet sampling frequency requirements for ARC based on the additional volume of soil being excavated. The soil disposal sampling results are summarized on Table 2. The completed MassDEP Bill of Lading has been submitted to MassDEP via eDEP, Transaction Number 855371.

3.4 Monitoring Well Installation

Based on the exceedances of petroleum hydrocarbons in southern excavation sidewall samples, additional soil and groundwater investigation was conducted to delineate the extent of petroleum impacts and assess the potential for off-Site migration toward the residential properties and school located across Bellis Circle to the south. On September 13, 2016, EBI oversaw the installation of five (5) soil borings which were converted into permanent groundwater monitoring wells. The wells locations were selected to assess concentrations of EPH and VPH in soil of the excavation where further excavation could not be conducted.

Bronson Drilling completed the soil borings and well installation using a direct push drill rig. Soil samples were collected continuously in each boring location at four-foot intervals to a completion depth of 16-feet bgs. The vapor headspace of each soil sample was field-screened with a PID and recorded in Boring Logs included as Appendix A. PID readings ranged from 0.0 to 224 ppm. The highest PID readings and olfactory evidence of petroleum impacts to soil were observed at a depth of 8 to 12-feet bgs in boring EB-16. PID readings in the remaining borings were around background levels.

One-inch PVC monitoring wells were installed in the void space of each borehole to depths of approximately 15-feet bgs. The wells were constructed of 10-feet of 1-inch schedule 40 well screen (0.01-inch slot) across the water table and completed to grade with solid 1-inch schedule 40 well riser. The annular space around the screened interval was backfilled with filter sand to approximately 2-feet above the screened interval. The remaining void space was filled with dry bentonite. Each well was finished with an aluminum road box set in concrete. Following installation, each well was developed by purging 1.5-3 gallons of groundwater to ensure adequate communication with the surrounding unconfined aquifer and to reduce turbidity in the water column.

3.5 Soil Analysis

A total of seven (7) soil samples were collected for laboratory analysis of for EPH and VPH. Soil samples were selected based on field screening analysis and from soil strata anticipated to contain the highest concentrations of petroleum contaminants (Fine sands and silt proximal to the water table). The laboratory results for these samples are summarized in Table 1.

Concentrations of EPH and VPH were detected above laboratory method detection limits in the soil sample collected from EB-16 at a depth of 9 to 12 feet bgs, but below Method 1 S-1/GW-2 and S-1/GW-3 standards. This sample represents the worst case condition encountered in soil along the southern Disposal Site Boundary, as evidenced by the PID headspace reading of 224 ppm. No concentrations of EPH or VPH were detected above laboratory method detection limits in the soil sample collected from EB-16 at a depth of 15 to 16 feet bgs. Additionally, no concentrations of EPH or VPH were detected above laboratory method detection limits in the soil samples collected from EB-12, EB-13, EB-14 and EB-15.

3.6 Groundwater Analysis

EBI returned to the Site on September 16, 2016 to collect groundwater samples from four (4) of the five (5) groundwater monitoring wells (EB-13, EB-14, EB-15 and EB-16). Prior to sampling, EBI gauged the depth to groundwater at each location which ranged from 9.26 to 10.90 feet below grade. Low-flow sampling was performed at each location in accordance with the USEPA low-flow guidelines. Groundwater samples were collected from each well in laboratory provided containers, cooled on ice and submitted under Chain of Custody documentation to Con-Test for analysis for EPH and VPH by the MassDEP Test Method.

Results of the groundwater sampling revealed concentrations EPH above laboratory method detection limits in the groundwater sample collected from EB-16. The concentrations of EPH in groundwater were compared to Method 1 GW-2 and GW-3 standards. None of the concentrations of EPH in groundwater exceeded Method 1 GW-2 and GW-3 standards. Concentrations of VPH were not detected above laboratory method detection limits in the groundwater sample collected from EB-16. No concentrations of EPH or VPH were detected above laboratory method detection limits in the groundwater samples collected from EB-13, EB-14 and EB-15.

A summary of the groundwater analytical results is attached as Table 3. Groundwater sampling locations are shown on Figures 3 and 4. Laboratory analytical reports are included in Appendix B.

3.7 Relative Groundwater Elevation Survey

On September 16, 2016, EBI performed a relative elevation survey of the five (5) newly installed monitoring wells (EB-12 through EB-16) as well one existing monitoring well (EB-07) located at the Site. Each of the six (6) groundwater monitoring wells were surveyed relative to an arbitrary benchmark established on-site and assumed to be at an elevation of 100-feet. Depth to groundwater measurements were obtained from each well in order to determine the relative groundwater surface elevations at each location. The Depth to groundwater measurements ranged from approximately nine to ten feet across the Site. The surveyed well elevations and depths to groundwater measurements in each well were used to establish a localized groundwater flow direction across the Site. Only slight differences in groundwater elevations in each of the wells was observed. However, the relative groundwater elevation survey indicates groundwater flow direction to the southwest. It is important to note the extensive excavation and subsequent backfilling has likely impacted the localized groundwater level. In particular, the groundwater depth in EB-07 located approximately 1-foot west-southwest of the excavation, was likely biased low based on the removal of approximately 6 vertical feet of saturated soils directly to the east.

A groundwater elevation contour map is included as Figure 5.

4.0 SUMMARY OF SUBSURFACE CONDITIONS

4.1 Subsurface Stratigraphy

A total of sixteen (16) soil borings have been advanced at the Site both prior to and following soil excavation. Soil stratigraphy encountered during the completion of soil borings and excavation activities consisted of shallow urban fill material comprised of sands and gravels with varying quantities of coal, coal ash, brick, glass, railroad ties/ spurs, plastic and various metal fragments. The urban fill material extended to depths up 7-feet bgs across the Site. The shallow fill layer was generally underlain by light brown fine sands and silt beginning between 3 and 7-feet bgs and extending to depths of 13 to 15 feet bgs. Clay lenses were observed in each boring location and within the excavation at varying depths intermittent with the fine sand and silt layers. Generally, a predominantly clay layer was observed between 13 and 15 feet bgs and extended to depths of at least 20-feet bgs. Soil boring logs including detailed descriptions of soil stratigraphy at various locations throughout the Site are included in Appendix A.

4.2 Groundwater Conditions

Depth to groundwater at the Site was measured at depths of 8.50 to 11.55 feet bgs. The groundwater table across the Site was generally lower in August and September than June and July, based upon an ongoing drought in the area. A relative groundwater elevation survey conducted on September 16, 2016 indicated only slight differences in groundwater elevations in each of the existing permanent monitoring wells. However, the relative groundwater elevation survey indicates groundwater flow direction to the southwest. It is important to note the extensive excavation and subsequent backfilling has likely impacted the localized groundwater level. In particular, the groundwater depth in EB-07 located approximately 1-foot west-southwest of the excavation, was likely biased low based on the removal of approximately 6 vertical feet of saturated soils to the east and southeast.

Information on the nature and extent of Site OHM are presented in the following subsections.

4.3 Characterization of Source(s) of OHM

The source of OHM, specifically petroleum hydrocarbons, is attributed to the historic storage of heating oil in onsite UST(s) and/or AST(s). Persons with knowledge of the property indicated former USTs were removed from the Site in the 1980s, however, no removal documentation was readily available. The Site has existed primarily as vacant land/ paved parking from the 1960's to present, with a small shed formerly located along the southern/ central portion of the Site.

4.4 Nature and Extent of OHM Impacts

The nature of OHM impacts to the soil and groundwater at the Site is by petroleum hydrocarbons associated with historic uses of the property. Analytical results from post-excavation soil samples are summarized in Table 1. Groundwater analytical data is summarized in Table 3. The laboratory analytical reports are provided in Appendix B. Based upon the OHM impacts discussed below, the Disposal Site Boundary was established and is shown on Figure 4.

4.4.1 Extent of Soil Impacts

The post-excavation analytical results indicate concentrations of EPH (C_9-C_{18} aliphatics) and VPH (C_9-C_{10} aromatics) above Method 1 soil standards along the western, southern and eastern excavation sidewalls in four (4) of the twenty-one (21) samples collected. Samples collected along the northern wall of the Disposal Site Boundary did not indicate concentrations of EPH or VPH above Method 1 standards. Concentrations of EPH and VPH were not detected above laboratory method detection limits from soil samples collected from the base of the excavation.

Western Wall

A narrow zone (7.5-8 feet bgs) of petroleum impacted soil was left in place along the western excavation sidewall. Concentration of C_9-C_{18} aliphatic hydrocarbons were detected slightly above Method 1 standards in sample S-9 collected from this zone. Soil samples S-8 and S-10 collected directly above and below this localized 6-inch zone, respectively did not indicate concentrations of petroleum hydrocarbons above laboratory method detections limits or Method 1 standards. In addition, all other post excavation soil samples from the western sidewall did not contain concentrations of petroleum hydrocarbons above laboratory method detections limits or Method 1 standards. The sampling results along the western excavation sidewall demonstrate residual petroleum hydrocarbons are limited in extent.

While not included within the Disposal Site Boundary, soil borings EB-01 and EB-02 located in the western portion of the property also did not contain concentrations of petroleum hydrocarbons above laboratory method detections limits or Method 1 standards. These data points provide further evidence that the localized residual impacts along the western excavation side wall do not extend significantly beyond the limits of soil excavation.

Southern Wall

Residual concentrations of petroleum hydrocarbons are present along the southern sidewall of the excavation at depths ranging between 7 and 11 feet. Concentrations of C_9-C_{18} aliphatic hydrocarbons and C_9-C_{10} aromatic hydrocarbons above Method 1 standards were detected in sample S-11 collected along the southern-central excavation side wall at a depth of 7 to 11 feet. Concentrations of C_9-C_{10} aromatic hydrocarbons above the Method 1 standard were also detected in sample S-27 collected from the southeastern excavation side wall at a depth of 9-feet. No other post excavation sample collected from the southern excavation sidewall contain EPH or VPH compounds above Method 1 S-1 soil standards (see Table 1).

Because the excavation could not feasibly be extended farther to the south without undermining the adjacent roadway, utility poles and subsurface utilities, additional post excavation borings EB-14 through EB-16 were advanced farther south of the excavation, just to the north of the Bellis Circle right of way. Soil samples collected from these borings did not contain concentrations of petroleum hydrocarbons above Method 1 S-1 soil standards. A sample collected from EB-16 at a depth of 9 to 12 feet bgs exhibited a PID reading of 224 ppmv, however, laboratory analyses of this sample indicated low concentrations of petroleum hydrocarbons, below Method 1 standards. A deeper sample from EB-16 also indicated no petroleum hydrocarbons present above laboratory method detection limits.

Based on these data, the residual petroleum hydrocarbons present along the southern excavation sidewall do not extend beyond the property boundary and into the Bellis Circle right-of-way.

Eastern Wall

Sample S-29 collected along the eastern excavation wall at a depth of 7 to 9 feet bgs indicated residual C_9-C_{18} aliphatic hydrocarbons and C_9-C_{10} aromatic hydrocarbons above Method 1 standards. Sample S-29 represents a localized 2-foot zone of impacted soil. Soil samples collected directly above and below this localized 2-foot zone did not indicate concentrations of petroleum hydrocarbons above laboratory

method detections limits or Method 1 standards. Sample S-22 located at a similar depth and proximal to S-29 along the eastern excavation wall indicated low concentrations of petroleum hydrocarbons, below Method 1 standards. The sampling results along the eastern excavation sidewall demonstrate residual petroleum hydrocarbons are limited in extent. Soil samples collected from soil borings EB-04 and EB-13 advanced proximal to S-29 did not indicate concentrations of petroleum hydrocarbons above laboratory method detection limits. The data from these soil borings indicate that the localized impacts along the eastern excavation wall do not extend significantly beyond the limits of excavation and/or beyond the eastern property boundary.

Residential apartments are located approximately 115-east of the Disposal Site Boundary's eastern border. Soil samples collected between S-29 and the eastern residential properties indicate that residual petroleum impacts to soil do not impact the nearby residences.

4.4.2 Extent of Groundwater Impacts

Groundwater analytical data collected both pre and post excavation do no suggest significant impacts to groundwater throughout the Site. Concentrations of petroleum hydrocarbons have not been detected above MCP RCGW-2 or Method 1 GW-2 or GW-3 standards in thirteen samples collected from onsite monitoring wells. Locations exhibiting the highest concentrations of petroleum hydrocarbons were located in the central portion of the Disposal Site Boundary and were removed during the course of excavation.

Groundwater data collected from three monitoring wells (EB-14, EB-15 and EB-16) located along the southern property boundary were used to assess the potential for offsite migration of petroleum hydrocarbons toward the residences and school located on the southern side of Bellis Circle. As discussed in Section 4.2.1, residual petroleum hydrocarbons in soil are present along the southern excavation sidewall but do not extend farther south into the Bellis Circle right-of-way. Petroleum hydrocarbons were not detected in two of the three groundwater samples collected south of the excavation and only low concentrations of petroleum hydrocarbons were detected in the third groundwater sample (EB-16), but below Method 1 standards. Therefore, petroleum hydrocarbon impacts to groundwater do not appear to extend beyond the public right of way to the downgradient residences and school.

Groundwater data collected from monitoring well EB-13 suggest that residual petroleum hydrocarbons in soil along the eastern excavation sidewall have not impacted groundwater east of the excavation area. Similarly, groundwater data collected from monitoring well EB-07 suggest that residual petroleum hydrocarbons in soil along the western excavation sidewall have not impacted groundwater west of the Disposal Site Boundary.

5.0 REPRESENTATIVENESS EVALUATION AND DATA USABILITY ASSESSMENT (REDUA)

A Data Representativeness and Data Usability Assessment as conducted on environmental samples collected by EBI at the Site in accordance with the requirements of 310 CMR 40.1056(2) of the MCP. The Data Representativeness and Data Usability Assessment was performed following the guidance presented in MassDEP Guidance Document *WSC-07-350 - MCP Representativeness Evaluations and Data Usability Assessments.*

5.1 Conceptual Site Model

The source of OHM detected in soil and groundwater at the Site is heating oil from former onsite petroleum storage tanks. Heating oil was reportedly stored in UST(s) and AST(s) at the Site by the Diamond Coal Company as early as 1935 through the 1960's. All UST(s) were reportedly removed the

Site in in the 1980's. UST(s) were not discovered at the Site during a GPR survey or extensive soil excavation. ASTs are not present at the Site, which is developed as an asphalt paved parking surface. There are no known uncontrolled sources OHM present at the Site.

Petroleum impacts to soil were identified immediately beneath the parking surface in the central portion of the Site and extended through the fill layer into native fine sand and silt layers to depths up to 15-feet bgs. The vertical migration of the release was limited by the presence of a confining clay located at depths ranging from 13 to 15 feet bgs. Narrow clay lenses were observed above 13-feet bgs, however, these strata were not consistent throughout the Site. Uniform confining clay between 13 and 15 feet bgs extending to at least 20-feet bgs prevented further downward migration of OHM.

Groundwater was observed at the Site at depth of approximately nine to ten feet. Pre- and post-excavation groundwater sampling has indicated no petroleum impacts to groundwater above MCP RCGW-2 Reportable Concentrations.

5.2 Use of Field/Screening Data

During EBI's Phase II ESA, field screening was performed on the soil samples and included visual and olfactory observations for evidence of impacts. Jar headspace screening was also performed using a PID to evaluate the presence of VOC impacts. The field observations and PID screening results were used to provide additional information on site and soil conditions, and were generally used as a basis for submitting samples for laboratory analyses. The visual, olfactory, and field screening evidence of contamination corresponded to the areas where the highest contamination was identified.

Additionally, field screening was performed on soil samples during excavation and was used to direct excavation efforts. Laboratory analytical results from pre-excavation soil samples were compared to field screening readings. A correlation between laboratory exceedances of Method 1 standards and PID field screening data was used to direct excavation efforts. During the soil boring program, soil samples with headspace PID readings less than 75 ppm as isobutylene did not exceed Method 1 standards. This information helped guide the excavation in conjunction with visual and olfactory field observations made by EBI field staff.

5.3 Sampling Rationale

As part of EBI's Phase II ESA, soil borings/monitoring were randomly installed across the site to evaluate potential subsurface impacts. Supplemental Phase II soil and groundwater sampling was conducted to further define the extent of soil impacts. The supplemental sampling targeted locations where concentration of petroleum hydrocarbon were detected above MCP Method 1 standards during the initial Phase II ESA.

During soil excavation activities, soil screening using a PID was performed to help direct the extent of necessary excavation. Several post-excavation soil samples were collected from the base and sidewalls of the excavation for laboratory analyses of EPH and VPH to quantify the residual petroleum hydrocarbon concentrations in soil following excavation.

Pre-excavation groundwater samples were collected from across the site including in the area where petroleum impacted soil were encountered. These samples did not indicate the presence of petroleum impacts to groundwater above applicable RC. Groundwater samples were collected from four permanent post-excavation monitoring wells installed east and south of the excavation and four temporary wells located east, south and west of the excavation to evaluate groundwater impacts cross gradient and downgradient of the excavation where residential receptors are located. Low concentrations of petroleum hydrocarbons (EPH) were detected above laboratory method detection limits in the groundwater sample collected from EB-16 and EB-07 (south), EB-04 (east) and EB-01 (west). The

concentrations of EPH were well below MCP Reporting Category RCGW-2. Additional groundwater sampling conducted across the Site, including five samples collected within the extents of the Disposal Site Boundary, did not indicate concentrations of EPH or VPH above MCP Reporting Category RCGW-2 or Method 1 standards.

The media and locations sampled during response actions are sufficient to support Site closure in accordance with the MCP.

5.4 Number, Spatial Distribution and Handling of Samples

Sample locations intended to assess the nature and extent of COCs were in sufficient number and density to support Site closure in accordance with the MCP. A total of thirty-seven (37) soils samples and thirteen (13) groundwater samples were collected to support the CSM. Sample locations were situated upgradient, downgradient and crossgradient of the Disposal Site and were collected from depths where evidence of impacts were observed, where applicable.

Concentrations of EPH (C_9-C_{18} aliphatics) and VPH (C_9-C_{10} aromatics) were detected above Method 1 S-1/GW-2 and S-1/GW-3 soil standards along the western, southern and eastern excavation sidewalls. Of the thirty-seven (37) samples submitted for laboratory analysis, only four (4) samples indicated concentrations of EPH and/or VPH above Method 1 standards. Additionally, five soil samples were collected prior to excavation for laboratory analysis and were removed during excavation. These samples were not used to calculate EPCs.

5.5 Temporal Distribution of Samples

There are no known ongoing or uncontrolled source of petroleum at the Disposal Site. Therefore, concentration in soil and groundwater are not expected to increase over time. As such additional temporal sampling of soil is not warranted. Concentrations of petroleum in groundwater have not exceeded MCP Reporting Category RCGW-2, Method 1 GW-2 or GW-3 standards. Therefore, temporal groundwater sampling was not conducted and is not warranted at the Disposal Site.

5.6 Data Gaps

No significant data gaps were identified in the sampling and analytical information.

5.7 Inconsistency and Uncertainty

No significant inconsistencies or uncertainties were identified in the Site data.

5.8 Information Considered Unrepresentative

No unrepresentative data was identified.

5.9 Analytical Data Usability

The chosen analytical methods of EPH/VPH analysis via the MassDEP Test Methods were appropriate given the COCs were petroleum constituents. According to data quality assessment information provided by and Con-Test Analytical, all sample analyses meet the requirements for Presumptive Certainty. Several QA/QC non-conformances were identified in the laboratory Case Narratives for soil and groundwater data that resulted in potential high or low bias in some of the sample data. In general, all of the analytical data was considered be of a sufficient level of precision and accuracy, and were otherwise considered usable to characterize the Disposal Site soil and groundwater. All laboratory reporting limits were at, or

below, the applicable standards. There were no significant QA/QC non-conformances associated with the analytical results for EPH/VPH analyses that would impact overall data usability or the conclusions of this PSS.

5.10 Field Data Usability

Soil and groundwater sample containers were packed on ice at approximately 4° Celsius in coolers and were accompanied by complete chain of custody forms from the time of sample collection until laboratory delivery. All sample chemical preservation and cooling were appropriately achieved. All samples were analyzed within the allowable holding time.

5.11 Rejection of Analytical Data as the Result of Gross Failure

No data was rejected due to gross failure of quality control.

5.12 Representativeness Evaluation and Data Usability Summary

Based on a review of established standard methods and procedures for collection and analysis of data, the data collected as part of this investigation are considered to be of comparable quality over the entire sampling period. The analytical deviations cited in the laboratory case narratives are not expected to have significantly impacted the usability of the Site data. Therefore, the data set can be relied upon to support a *Permanent Solution*, is representative of the Disposal Site, and is scientifically valid and defensible.

6.0 RISK CHARACTERIZATION

A Method 1 Risk Characterization was performed to demonstrate that Disposal Site conditions represent No Significant Risk to human health, environment, and public welfare. A separate evaluation of the potential risks safety is also included.

6.1 Method 1 Soil and Groundwater Categories

Currently the Site is a paved vacant lot used for parking buy a nearby restaurant and elementary school. Current use of the Site by both children and adults is considered to be low frequency and low intensity uses as defined at 310 CMR 40.0933(4) as both adults and children are present at the Site for period of less than two hours per day. Based on these conditions, the current MCP soil category for the Site is S-3. However, soil concentration have been compared to S-1 standards to avoid the need for a Site activity and use limitation.

The Site is not located within a MassDEP approved Zone II, IWPA, Zone A of a Class A surface water body, or a Potential Drinking Water Source Area. No private drinking water wells are located within 500 feet of the Site. Based on this information, the applicable groundwater category for the Site are GW-2 and GW-3.

The applicable Method 1 soil and groundwater categories used for this Method 1 risk characterization are S-1/GW-2 and S-1/GW-3 for soil, and GW-2 and GW-3 for groundwater.

6.2 Development of EPCs and Comparison to Method 1 Standards

EPCs for each EPH and VPH constituent were calculated by averaging the concentrations from each sample located within the Disposal Site Boundary, including non-detect samples which were included in the calculation as one half (0.5) of the laboratory method detection limit per CMR 40.0926(b). Soil

analytical data and the calculated EPCs are summarized in Table 1. Use of the average (i.e., arithmetic mean) as the soil EPH was considered to be a conservative estimate of the exposure because twenty-seven (27) of the thirty-seven (37) post-excavation samples had EPH and VPH concentrations below laboratory method detection limits and the detection limits. Concentrations of aliphatic and aromatic hydrocarbons were detected above MCP Method 1 Cleanup Standards in four (4) post-excavation and detected concentrations did not exceed 10 times the Method 1 standard in any of the samples. Therefore, use of the arithmetic mean was considered appropriate in accordance with the requirements of 310 CMR 40.0926(3). The calculated EPCs are below Method 1 S1/GW-2 and S-1/GW-3 soil standards for each EPH and VPH analyte.

Results of groundwater sampling across the property and proximal to the Disposal Site Boundary have not revealed concentrations of EPH or VPH in groundwater in excess of MCP Reporting Category RCGW-2 and/or Method 1 GW-2 / GW-3 standards.

6.3 Characterization of Risks to Human Health, Public Welfare and the Environment

Based on the comparison of soil concentrations to Method 1 S1/GW-2 and S-1/GW-3 soil standards, and groundwater concentrations to Method 1 GW-2 /GW-3 standards, a condition of No Significant Risk to human health, public welfare and the environment exists at the Site for all current and foreseeable future Site activities and uses.

6.4 Method 1 Characterization of Risks to Safety

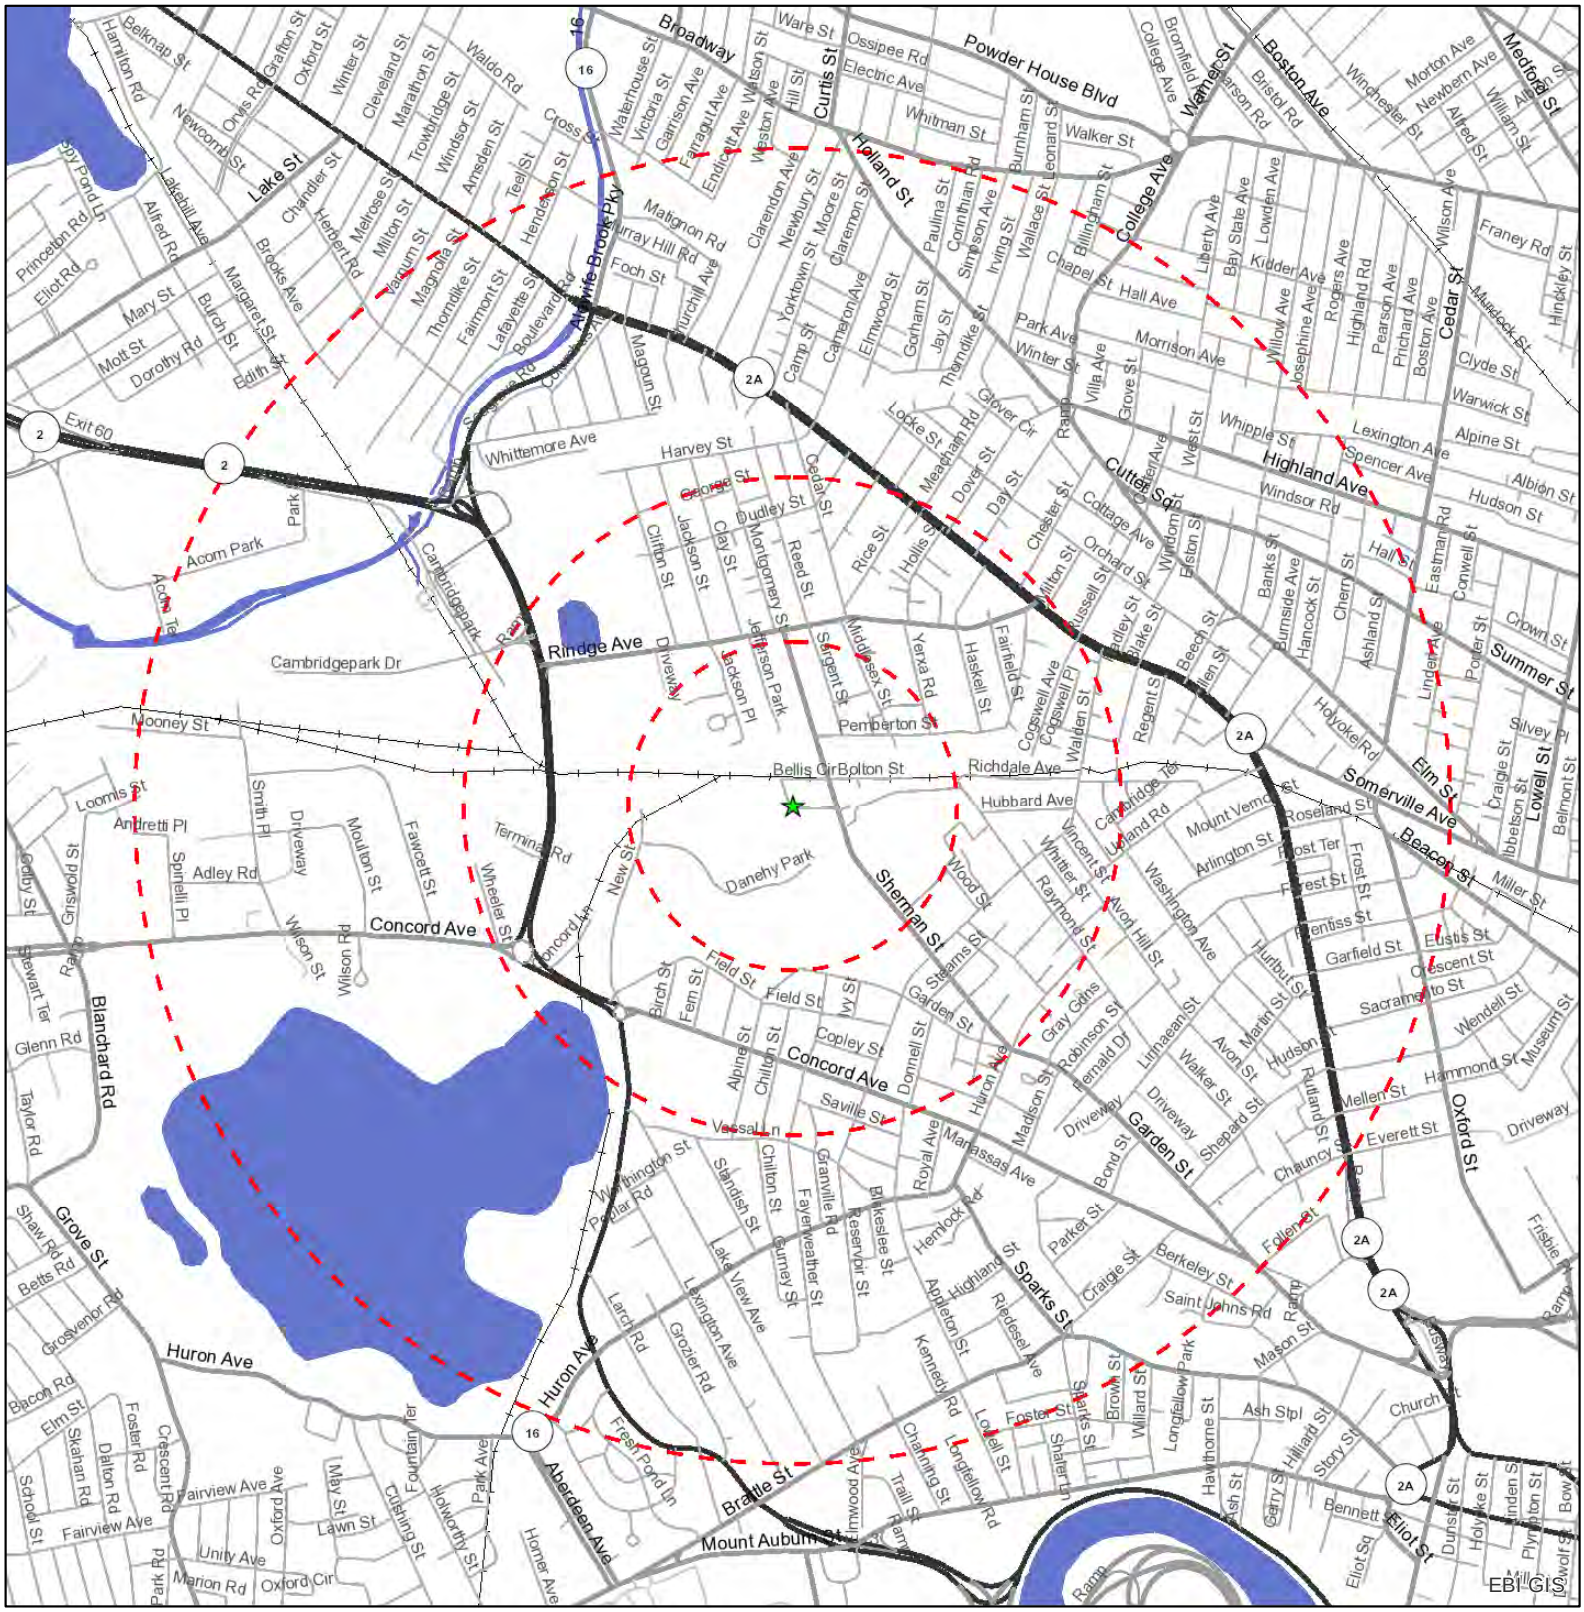
Pursuant to 310 CMR 40.0941(2) and 310 CMR 40.0960, a separate evaluation of the potential risks to safety is included in this section. A condition of No Significant risk to safety exists because Site conditions do not pose a threat of physical harm or bodily injury to people due to the presence of:

- rusted or corroded drums or containers;
- pits and lagoons;
- fire or explosion hazards;
- un-containerized hazardous material or wastes.

7.0 FEASIBILITY OF ACHIEVING BACKGROUND

The feasibility of achieving background conditions at the Site was evaluated using the guidance specified in MassDEP Policy #WSC-04-160 Conducting Feasibility Evaluations under The MCP. The contaminant of concern at the Site consist of petroleum hydrocarbons including C_9-C_{18} aliphatics and VPH C_9-C_{10} aromatics which are considered non-persistent compounds in the environment. In accordance with MassDEP guidance, achieving background conditions at the Site for degradable/nonpersistent contaminants is considered categorically infeasible as the benefits of additional remedial actions to achieve or approach background for these contaminants would be considered insufficient to justify the costs of those actions.

8.0 PUBLIC INVOLVEMENT



Pursuant to 310 CMR 40.1403(3)(f), EBI has prepared letters to the municipal officials to inform them of the availability of this PSS with No Conditions and RAM Completion including instructions on how to obtain a copy. A copy of the letters to the municipal officials is presented in Appendix C.

9.0 LSP CONCLUSIONS, CERTIFICATIONS AND OPINIONS

EBI prepared this PSS report in accordance with the requirements for Content of Permanent Solution Statements at 310 CMR 40.1056. Based on the work completed at the Site, EBI presents the following conclusions, certifications and opinions:

- It is the LSP's Opinion that the assessment and remedial activities completed to date at this Disposal Site and described in this PSS are sufficient to demonstrate that a condition of No Significant Risk of harm to health, safety, public welfare and the environment exists at the Disposal Site for all current and reasonably foreseeable future site activities and uses, and that the requirements for a Permanent Solution have been met. The objectives set forth in RAM Plan have been met as demonstrated by the calculated soil EPCs for the contaminants of concern which are below applicable Method 1 standards.

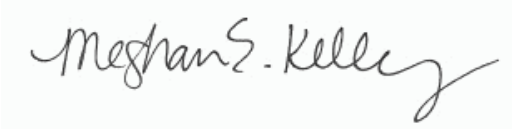
MADEP-EPH-04-1.1

SPE cartridge contamination with non-petroleum compounds, if present, is verified by GC/MS in each method blank per extraction batch and excluded from C 11-C22 aromatic range fraction in all samples in the batch. No significant modifications were made to the method.

MADEP-VPH-04-1.1

No significant modifications were made to the method. All VPH samples were received preserved properly at pH <2 in the proper containers as specified on the chain-of-custody form unless specified in this narrative.

No significant modifications were made to the method. All VPH samples were received preserved properly in methanol with a soil/methanol ratio of 1:1 +/- 25% completely covered by methanol in the proper containers specified on the chain-of-custody form unless specified in this narrative.



SW-846 6010C/D SW-846 6020A/B

For NC, Metals methods SW-846 6010D and SW-846 6020B are followed, and for all other states methods SW-846 6010C and SW-846 6020A are followed.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit
DL	Method Detection Limit
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
L-02	Laboratory fortified blank/laboratory control sample recovery and duplicate recoveries outside of control limits. Data validation is not affected since all results are "not detected" for associated samples in this batch and bias is on the high side.
L-04	Laboratory fortified blank/laboratory control sample recovery and duplicate recovery are outside of control limits. Reported value for this compound is likely to be biased on the low side.
L-07	Either laboratory fortified blank/laboratory control sample or duplicate recovery is outside of control limits, but the other is within limits. RPD between the two LFB/LCS results is within method specified criteria.
L-07A	Either laboratory fortified blank/laboratory control sample or duplicate recovery is outside of control limits, but the other is within limits. RPD outside of control limits. Reduced precision anticipated for any reported result for this compound.
L-14	Compound classified by MA CAM as difficult with acceptable recoveries of 40-160%. Recovery does not meet 70-130% criteria but does meet difficult compound criteria.
MS-07	Matrix spike recovery is outside of control limits. Analysis is in control based on laboratory fortified blank recovery. Possiblity of sample matrix effects that lead to low bias for reported result or non-homogeneous sample aliquot cannot be eliminated.
O-01	Soil/methanol ratio does not meet method specifications. Excess amount of soil. Sample was completely covered with methanol, but with less than the method-specified amount.
O-32	A dilution was performed as part of the standard analytical procedure.
R-05	Laboratory fortified blank duplicate RPD is outside of control limits. Reduced precision is anticipated for any reported value for this compound.
RL-05	Elevated reporting limit due to high concentration of target compounds. MA CAM reporting limit not met.
RL-06	Elevated reporting limit due to high concentration of non-target compounds. MA CAM reporting limit not met.
RL-07	Elevated reporting limit based on lowest point in calibration. MA CAM reporting limit not met.
RL-08	Elevated reporting limit due to sample matrix interference. MA CAM reporting limit not met.
V-05	Continuing calibration did not meet method specifications and was biased on the low side for this compound. Increased uncertainty is associated with the reported value which is likely to be biased on the low side.
V-16	Response factor is less than method specified minimum acceptable value. Reduced precision and accuracy may be associated with reported result.
V-20	Continuing calibration did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit
DL	Method Detection Limit
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
L-04	Laboratory fortified blank/laboratory control sample recovery and duplicate recovery are outside of control limits. Reported value for this compound is likely to be biased on the low side.
O-01	Soil/methanol ratio does not meet method specifications. Excess amount of soil. Sample was completely covered with methanol, but with less than the method-specified amount.
RL-05	Elevated reporting limit due to high concentration of target compounds. MA CAM reporting limit not met.
RL-14	Elevated reporting limit due to foaming sample matrix. MA CAM reporting limit not met.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit
DL	Method Detection Limit
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.

H-01	Recommended sample holding time was exceeded, but analysis was performed before 2X the allowable holding time.
L-14	Compound classified by MA CAM as difficult with acceptable recoveries of 40-160%. Recovery does not meet 70-130% criteria but does meet difficult compound criteria.
O-32	A dilution was performed as part of the standard analytical procedure.
RL-07	Elevated reporting limit based on lowest point in calibration. MA CAM reporting limit not met.
S-01	The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.
S-02	The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract.
S-23	Surrogate recovery outside of control limits in BS/MS spiked sample, all reported analytes are within control criteria, data not significantly affected.
V-05	Continuing calibration did not meet method specifications and was biased on the low side for this compound. Increased uncertainty is associated with the reported value which is likely to be biased on the low side.
V-16	Response factor is less than method specified minimum acceptable value. Reduced precision and accuracy may be associated with reported result.
V-20	Continuing calibration did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

MADEP-VPH-04-1.1

Qualifications:

O-01

Soil/methanol ratio does not meet method specifications. Excess amount of soil. Sample was completely covered with methanol, but with less than the method-specified amount.

Analyte & Samples(s) Qualified:

16H1307-01[S-19 (8-9') N]

MADEP-EPH-04-1.1

SPE cartridge contamination with non-petroleum compounds, if present, is verified by GC/MS in each method blank per extraction batch and excluded from C 11-C22 aromatic range fraction in all samples in the batch. No significant modifications were made to the method.

MADEP-VPH-04-1.1

No significant modifications were made to the method. All VPH samples were received preserved properly in methanol with a soil/methanol ratio of 1:1 +/- 25% completely covered by methanol in the proper containers specified on the chain-of-custody form unless specified in this narrative.

SW-846 6010C/D SW-846 6020A/B

For NC, Metals methods SW-846 6010D and SW-846 6020B are followed, and for all other states methods SW-846 6010C and SW-846 6020A are followed.

The results of analyses reported only relate to samples submitted to the Con-Test Analytical Laboratory for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

MADEP-VPH-04-1.1

Qualifications:

O-01

Soil/methanol ratio does not meet method specifications. Excess amount of soil. Sample was completely covered with methanol, but with less than the method-specified amount.

Analyte & Samples(s) Qualified:

16H1161-01[S-1 (8-9)], 16H1161-02[B-1 (12) NW], 16H1161-03[S-2 (7-8)], 16H1161-04[B-2 (13) SW], 16H1161-05[S-5 (7-9) W], 16H1161-06[S-8 (7-7.5) W], 16H1161-07[S-9 (7.5-8) W], 16H1161-08[S-10 (8-9) W]

RL-05

Elevated reporting limit due to high concentration of target compounds. MA CAM reporting limit not met.

Analyte & Samples(s) Qualified:

C5-C8 Aliphatics
16H1161-07[S-9 (7.5-8) W]

Naphthalene
16H1161-07[S-9 (7.5-8) W]

Unadjusted C5-C8 Aliphatics
16H1161-07[S-9 (7.5-8) W]

MADEP-EPH-04-1.1

SPE cartridge contamination with non-petroleum compounds, if present, is verified by GC/MS in each method blank per extraction batch and excluded from C 11-C22 aromatic range fraction in all samples in the batch. No significant modifications were made to the method.

MADEP-VPH-04-1.1

No significant modifications were made to the method. All VPH samples were received preserved properly in methanol with a soil/methanol ratio of 1:1 +/- 25% completely covered by methanol in the proper containers specified on the chain-of-custody form unless specified in this narrative.

The results of analyses reported only relate to samples submitted to the Con-Test Analytical Laboratory for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit
DL	Method Detection Limit
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.

L-04	Laboratory fortified blank/laboratory control sample recovery and duplicate recovery are outside of control limits. Reported value for this compound is likely to be biased on the low side.
L-07	Either laboratory fortified blank/laboratory control sample or duplicate recovery is outside of control limits, but the other is within limits. RPD between the two LFB/LCS results is within method specified criteria.
O-01	Soil/methanol ratio does not meet method specifications. Excess amount of soil. Sample was completely covered with methanol, but with less than the method-specified amount.
RL-05	Elevated reporting limit due to high concentration of target compounds. MA CAM reporting limit not met.

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

MADEP-VPH-04-1.1

Qualifications:

O-01

Soil/methanol ratio does not meet method specifications. Excess amount of soil. Sample was completely covered with methanol, but with less than the method-specified amount.

Analyte & Samples(s) Qualified:

16H1308-01[B-8 (14')]

MADEP-EPH-04-1.1

SPE cartridge contamination with non-petroleum compounds, if present, is verified by GC/MS in each method blank per extraction batch and excluded from C11-C22 aromatic range fraction in all samples in the batch. No significant modifications were made to the method.

MADEP-VPH-04-1.1

No significant modifications were made to the method. All VPH samples were received preserved properly in methanol with a soil/methanol ratio of 1:1 +/- 25% completely covered by methanol in the proper containers specified on the chain-of-custody form unless specified in this narrative.

The results of analyses reported only relate to samples submitted to the Con-Test Analytical Laboratory for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit
DL	Method Detection Limit
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
O-01	Soil/methanol ratio does not meet method specifications. Excess amount of soil. Sample was completely covered with methanol, but with less than the method-specified amount.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit
DL	Method Detection Limit
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
O-01	Soil/methanol ratio does not meet method specifications. Excess amount of soil. Sample was completely covered with methanol, but with less than the method-specified amount.
RL-05	Elevated reporting limit due to high concentration of target compounds. MA CAM reporting limit not met.

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

MADEP-VPH-04-1.1

Qualifications:

L-07

Either laboratory fortified blank/laboratory control sample or duplicate recovery is outside of control limits, but the other is within limits. RPD between the two LFB/LCS results is within method specified criteria.

Analyte & Samples(s) Qualified:

Decane

B157474-BSD1

O-01

Soil/methanol ratio does not meet method specifications. Excess amount of soil. Sample was completely covered with methanol, but with less than the method-specified amount.

Analyte & Samples(s) Qualified:

16H1393-01[S-22 (6-7)], 16H1393-02[B-9 (16-17)]

MADEP-EPH-04-1.1

SPE cartridge contamination with non-petroleum compounds, if present, is verified by GC/MS in each method blank per extraction batch and excluded from C11-C22 aromatic range fraction in all samples in the batch. No significant modifications were made to the method.

MADEP-VPH-04-1.1

No significant modifications were made to the method. All VPH samples were received preserved properly in methanol with a soil/methanol ratio of 1:1 +/- 25% completely covered by methanol in the proper containers specified on the chain-of-custody form unless specified in this narrative.

The results of analyses reported only relate to samples submitted to the Con-Test Analytical Laboratory for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

MADEP-EPH-04-1.1

SPE cartridge contamination with non-petroleum compounds, if present, is verified by GC/MS in each method blank per extraction batch and excluded from C11-C22 aromatic range fraction in all samples in the batch. No significant modifications were made to the method.

MADEP-VPH-04-1.1

No significant modifications were made to the method. All VPH samples were received preserved properly in methanol with a soil/methanol ratio of 1:1 +/- 25% completely covered by methanol in the proper containers specified on the chain-of-custody form unless specified in this narrative.

The results of analyses reported only relate to samples submitted to the Con-Test Analytical Laboratory for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit
DL	Method Detection Limit
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
L-04	Laboratory fortified blank/laboratory control sample recovery and duplicate recovery are outside of control limits. Reported value for this compound is likely to be biased on the low side.
O-01	Soil/methanol ratio does not meet method specifications. Excess amount of soil. Sample was completely covered with methanol, but with less than the method-specified amount.
RL-05	Elevated reporting limit due to high concentration of target compounds. MA CAM reporting limit not met.

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

MADEP-EPH-04-1.1

Qualifications:

MS-22

Either matrix spike or MS duplicate is outside of control limits, but the other is within limits. RPD between the two MS/MSD results is within method specified criteria.

Analyte & Samples(s) Qualified:

n-Nonane
B158265-MS1

MADEP-VPH-04-1.1

Qualifications:

O-01

Soil/methanol ratio does not meet method specifications. Excess amount of soil. Sample was completely covered with methanol, but with less than the method-specified amount.

Analyte & Samples(s) Qualified:

16I0473-01[EB-12 (10-12')], 16I0473-02[EB-13 (10.5-11.5')], 16I0473-03[EB-14 (10-11')], 16I0473-04[EB-15 (8-11')], 16I0473-05[EB-15 (12-13')], 16I0473-06[EB-16 (9-12')], 16I0473-07[EB-16 (15-16')]

MADEP-EPH-04-1.1

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit
DL	Method Detection Limit
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
MS-22	Either matrix spike or MS duplicate is outside of control limits, but the other is within limits. RPD between the two MS/MSD results is within method specified criteria.

NOTES

- The report and graphics key are an integral part of these logs. All data and interpretations in this log are subject to the explanations and limitations stated in the report.
- Solid lines separating strata on the logs represent approximate boundaries only, dashed lines are inferred or extrapolated boundaries. Actual transitions may be gradual or differ from those represented.
- No warranty is provided as to the continuity of soil or rock conditions between individual sample locations.
- Logs represent general soil or rock conditions observed at the point of exploration on the date indicated.
- In general, Unified Soil Classification System (ASTM D2488/D2487) designations presented on the logs were based on visual classification in the field and were modified where appropriate based on gradation and index property testing.
- Fine grained soils that plot within the hatched area on the Plasticity Chart, and coarse grained soils with between 5% and 12% passing the No. 200 sieve require dual USCS symbols, ie., CL-ML, GW-GM, GP-GM, GW-GC, GP-GC, GC-GM, SW-SM, SP-SM, SW-SC, SP-SC, SC-SM.
- If sampler is not able to be driven at least 6 inches then 50/X indicates number of blows required to drive the identified sampler X inches with a 140 pound hammer falling 30 inches.

GROUNDWATER LEVEL INFORMATION:

▽ Perched groundwater was observed at approximately 5.5 ft. below ground surface during drilling.

▼ Groundwater was observed at approximately 10 ft. below ground surface at the end of drilling.

GENERAL NOTES:

1. Ground Surface Elevation based on drawing titled "Bellis Circle/Sherman St Drainage Improvements" prepared by SEA Consultants Inc., dated April 17, 2002.
2. When strata breaks are not observed in the split spoon, strata breaks are inferred based on rig behavior (bouncing, chattering, penetration resistance, drilling water color, etc.).
3. A Photo Ionization Detector (PID in ppm) was used for environmental field screening.
4. A composite sample with equal aliquots from grab samples G-3 to G-5 was submitted for environmental analysis.
5. The top 6 feet was pre-cleared using vacuum excavation.
6. Hollow Stem Auger with 4" ID was used from ground surface to depth of 10 feet bgs then switched to Drive and Wash with 3" ID casing to termination depth.
7. The exploration location and elevation are approximate and were estimated by Kleinfelder.

GROUNDWATER LEVEL INFORMATION:
▽ Groundwater was observed at approximately 10 ft. below ground surface during drilling.

GENERAL NOTES:
1. Ground Surface Elevation based on drawing titled "Bellis Circle/Sherman St Drainage Improvements" prepared by SEA Consultants Inc., dated April 17, 2002.
2. When strata breaks are not observed in the split spoon, strata breaks are inferred based on rig behavior (bouncing, chattering, penetration resistance, drilling water color, etc.).
3. A Photo Ionization Detector (PID in ppm) was used for environmental field screening.
4. The top 6 feet was pre-cleared using vacuum excavation.
5. Hollow Stem Auger with 4" ID was used from ground surface to depth of 10 feet bgs then switched to Drive and Wash with 3" ID casing to termination depth.
6. The exploration location and elevation are approximate and were estimated by Kleinfelder.

NOTES

- The report and graphics key are an integral part of these logs. All data and interpretations in this log are subject to the explanations and limitations stated in the report.
- Solid lines separating strata on the logs represent approximate boundaries only, dashed lines are inferred or extrapolated boundaries. Actual transitions may be gradual or differ from those represented.
- No warranty is provided as to the continuity of soil or rock conditions between individual sample locations.
- Logs represent general soil or rock conditions observed at the point of exploration on the date indicated.
- In general, Unified Soil Classification System (ASTM D2488/D2487) designations presented on the logs were based on visual classification in the field and were modified where appropriate based on gradation and index property testing.
- Fine grained soils that plot within the hatched area on the Plasticity Chart, and coarse grained soils with between 5% and 12% passing the No. 200 sieve require dual USCS symbols, ie., CL-ML, GW-GM, GP-GM, GW-GC, GP-GC, GC-GM, SW-SM, SP-SM, SW-SC, SP-SC, SC-SM.
- If sampler is not able to be driven at least 6 inches then 50/X indicates number of blows required to drive the identified sampler X inches with a 140 pound hammer falling 30 inches.

The boring was terminated at approximately 87 ft. below ground surface. The boring was backfilled with auger cuttings and gravel on April 01, 2026. Rock was encountered at a depth of 79 ft. during this exploration. Coring started at a depth of 79 ft.

GROUNDWATER LEVEL INFORMATION:
▽ Groundwater was observed at approximately 10 ft. below ground surface during drilling.

GENERAL NOTES:
1. Ground Surface Elevation based on drawing titled "Existing Condition Survey Sherman Street Cambridge, Massachusetts" prepared by WSP USA Inc., dated May 23, 2025.
2. When strata breaks are not observed in the split spoon, strata breaks are inferred based on rig behavior (bouncing, chattering, penetration resistance, drilling water color, etc.).
3. A Photo Ionization Detector (PID in ppm) was used for environmental field screening.

The boring was terminated at approximately 27 ft. below ground surface. The boring was backfilled with auger cuttings and gravel on March 30, 2026.

GROUNDWATER LEVEL INFORMATION:
▽ Groundwater was observed at approximately 10 ft. below ground surface during drilling.

GENERAL NOTES:
1. Ground Surface Elevation based on drawing titled "Existing Condition Survey Sherman Street Cambridge, Massachusetts" prepared by WSP USA Inc., dated May 23, 2025.
2. When strata breaks are not observed in the split spoon, strata breaks are inferred based on rig behavior (bouncing, chattering, penetration resistance, drilling water color, etc.).
3. A Photo Ionization Detector (PID in ppm) was used for environmental field screening.
4. A composite sample with equal aliquots from grab samples G-1 to G-5 was submitted for environmental analysis.
5. The top 6 feet was pre-cleared using vacuum excavation.

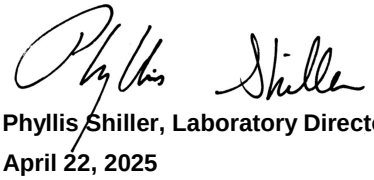
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.



Comments:

Results are reported on an ``as received`` basis, and are not corrected for dry weight.

Volatile Comment:
There was a suppression of the last internal standard in the low level analysis, all affected compounds are reported from the methanol preserved high level analysis which did not exhibit this interference.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Corrosivity is based solely on the pH analysis performed above.

Ignitability is based solely on the results of the closed cup flashpoint analysis performed above. Passed is >140 degree F.

The regulatory hold time for pH is immediately. This pH was performed in the laboratory and may be considered outside of hold-time.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Cyanide. This method is no longer listed in the current version of SW-846.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Sulfide. This method is no longer listed in the current version of SW-846.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Corrosivity is based solely on the pH analysis performed above.

Ignitability is based solely on the results of the closed cup flashpoint analysis performed above. Passed is >140 degree F.

The regulatory hold time for pH is immediately. This pH was performed in the laboratory and may be considered outside of hold-time.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Cyanide. This method is no longer listed in the current version of SW-846.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Sulfide. This method is no longer listed in the current version of SW-846.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Corrosivity is based solely on the pH analysis performed above.

Ignitability is based solely on the results of the closed cup flashpoint analysis performed above. Passed is >140 degree F.

The regulatory hold time for pH is immediately. This pH was performed in the laboratory and may be considered outside of hold-time.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Cyanide. This method is no longer listed in the current version of SW-846.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Sulfide. This method is no longer listed in the current version of SW-846.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Corrosivity is based solely on the pH analysis performed above.

Ignitability is based solely on the results of the closed cup flashpoint analysis performed above. Passed is >140 degree F.

The regulatory hold time for pH is immediately. This pH was performed in the laboratory and may be considered outside of hold-time.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Cyanide. This method is no longer listed in the current version of SW-846.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Sulfide. This method is no longer listed in the current version of SW-846.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Corrosivity is based solely on the pH analysis performed above.

Ignitability is based solely on the results of the closed cup flashpoint analysis performed above. Passed is >140 degree F.

The regulatory hold time for pH is immediately. This pH was performed in the laboratory and may be considered outside of hold-time.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Sulfide. This method is no longer listed in the current version of SW-846.

8260 Analysis:
1,4-Dioxane doesn't meet GW-1 criteria, this compound is analyzed by 8270SIM to achieve this criteria.

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Dissolved analysis requires filtration. Samples submitted from a preserved container are assumed to be field filtered.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Ignitability is based solely on the results of the closed cup flashpoint analysis performed above. Passed is >140 degree F.

The regulatory hold time for pH is immediately. This pH was performed in the laboratory and may be considered outside of hold-time.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Sulfide. This method is no longer listed in the current version of SW-846.

8260 Analysis:
1,4-Dioxane doesn't meet GW-1 criteria, this compound is analyzed by 8270SIM to achieve this criteria.

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Corrosivity is based solely on the pH analysis performed above.

Dissolved analysis requires filtration. Samples submitted from a preserved container are assumed to be field filtered.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Sample received was a solid, bulk, or caulk matrix; dry weight is assumed.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Corrosivity is based solely on the pH analysis performed above.

Ignitability is based solely on the results of the closed cup flashpoint analysis performed above. Passed is >140 degree F.

The regulatory hold time for pH is immediately. This pH was performed in the laboratory and may be considered outside of hold-time.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Cyanide. This method is no longer listed in the current version of SW-846.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Sulfide. This method is no longer listed in the current version of SW-846.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Corrosivity is based solely on the pH analysis performed above.

Ignitability is based solely on the results of the closed cup flashpoint analysis performed above. Passed is >140 degree F.

The regulatory hold time for pH is immediately. This pH was performed in the laboratory and may be considered outside of hold-time.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Cyanide. This method is no longer listed in the current version of SW-846.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Sulfide. This method is no longer listed in the current version of SW-846.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

SVOA Narration

Were all QA/QC performance criteria specified in the MADEP document CAM achieved? No.

QC Batch 833662 (Samples: CV61366, CV61368): -----

One or more surrogates is outside of criteria. (% Terphenyl-d14)

The LCS/LCSD RPD exceeds the method criteria for one or more analytes, but these analytes were not reported in the sample(s) so no variability is suspected. (Benzidine)

The MS and/or the MSD recovery is above the upper range for one or more analytes that were not reported in the sample(s), therefore no significant bias is suspected. (2-Nitroaniline)

The MS and/or the MSD recovery is above the upper range, therefore a slight high bias is possible. (Pyrene)

The MS/MSD RPD exceeds the method criteria for one or more analytes, therefore there may be variability in the reported result. (Benzidine, Fluoranthene, Pyrene)

The MS/MSD RPD exceeds the method criteria for one or more surrogates, therefore there may be variability in the reported result. (% Terphenyl-d14)

The QC recoveries for one or more analytes is below the method criteria. A slight low bias is likely. (Benzidine, Hexachlorocyclopentadiene)

Good morning,

I just noticed the COC is incorrect. The soil sample submitted for CV61368 KLF-105 (1-2) should be KLF-105 (0-4), would you make that change?

Thank you!

Lisa

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Corrosivity is based solely on the pH analysis performed above.

Ignitability is based solely on the results of the closed cup flashpoint analysis performed above. Passed is >140 degree F.

The regulatory hold time for pH is immediately. This pH was performed in the laboratory and may be considered outside of hold-time.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Cyanide. This method is no longer listed in the current version of SW-846.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Sulfide. This method is no longer listed in the current version of SW-846.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Sample received was a solid, bulk, or caulk matrix; dry weight is assumed.
If sample is a trip blank, dry weight is assumed.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Corrosivity is based solely on the pH analysis performed above.

Ignitability is based solely on the results of the closed cup flashpoint analysis performed above. Passed is >140 degree F.

The regulatory hold time for pH is immediately. This pH was performed in the laboratory and may be considered outside of hold-time.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Cyanide. This method is no longer listed in the current version of SW-846.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Sulfide. This method is no longer listed in the current version of SW-846.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Per 1.4.6 of EPA method 8270D, 1,2-Diphenylhydrazine is unstable and readily converts to Azobenzene. Azobenzene is used for the calibration of 1,2-Diphenylhydrazine.

Corrosivity is based solely on the pH analysis performed above.

Ignitability is based solely on the results of the closed cup flashpoint analysis performed above. Passed is >140 degree F.

The regulatory hold time for pH is immediately. This pH was performed in the laboratory and may be considered outside of hold-time.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Cyanide. This method is no longer listed in the current version of SW-846.

The reactivity, reported above, is based only on the EPA Interim Guidance for Reactive Sulfide. This method is no longer listed in the current version of SW-846.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.

SVOA Narration

Were all QA/QC performance criteria specified in the MADEP document CAM achieved? No.

QC Batch 834932 (Samples: CV65297): -----

The LCS/LCSD RPD exceeds the method criteria for one or more analytes, but these analytes were not reported in the sample(s) so no variability is suspected. (Benzidine)

The QC recoveries for one or more analytes is below the method criteria. A slight low bias is likely. (Benzidine, Hexachlorocyclopentadiene, N-Nitrosodimethylamine, Pyridine)

QC Batch 835021 (Samples: CV65299): -----

The QC recoveries for one or more analytes is below the method criteria. A slight low bias is likely. (Benzidine)

One or more analytes is below the method criteria. A low bias for these analytes is possible. (Aniline)

The LCS and/or the LCSD recovery is below the method criteria. All of the other QC is acceptable, therefore no significant bias is suspected. (2,2''-Oxybis(1-Chloropropane), Hexachlorocyclopentadiene)

The LCS/LCSD RPD exceeds the method criteria for one or more analytes, but these analytes were not reported in the sample(s) so no variability is suspected. (Bis(2-chloroethyl)ether, Hexachlorocyclopentadiene)
