## **1 EXECUTIVE SUMMARY**

The City of Cambridge is one of 22 communities located within the Mystic River Watershed. A State-wide water quality assessment has determined that the Mystic River is impaired due to contamination from nutrients and pathogens. This impairment designation has resulted in the development of an Alternative Total Maximum Daily Load (TMDL) for allowable discharges into the River. The Mystic River Alternative Phosphorus (P) TMDL developed by EPA, MassDEP, and the Mystic River Watershed Association (MyRWA) recommends reducing P export to the Mystic River by 67% to restore Massachusetts Surface Water Quality Standards (MASWQS) in the Mystic River.

As a Municipal Separate Storm Sewer System (MS4) community within the Mystic River Watershed, the City of Cambridge is required to develop a Phosphorus Source Identification Report subject to the requirements in the MS4 Permit, Appendix H to address Mystic River's impairment for phosphorus (P). The main elements of the report are the following:

1. Calculation of total MS4 area draining to the water quality limited receiving water segments or their tributaries;
2. All screening and monitoring results pursuant to part 2.3.4.7b of the Massachusetts MS4 General Permit Appendix H from outfalls targeting the receiving water segment(s);
3. Impervious area and Directly Connected Impervious Area (DCIA) for the target catchment;
4. Identification, delineation, and prioritization of potential catchments with high phosphorus loading;
5. Identification of potential retrofit opportunities or opportunities for the installation of structural BMPs during redevelopment, including the removal of impervious area;
6. Five sites selected by the City to meet Permit Year 5 requirements and the estimated construction costs for the potential BMPs.

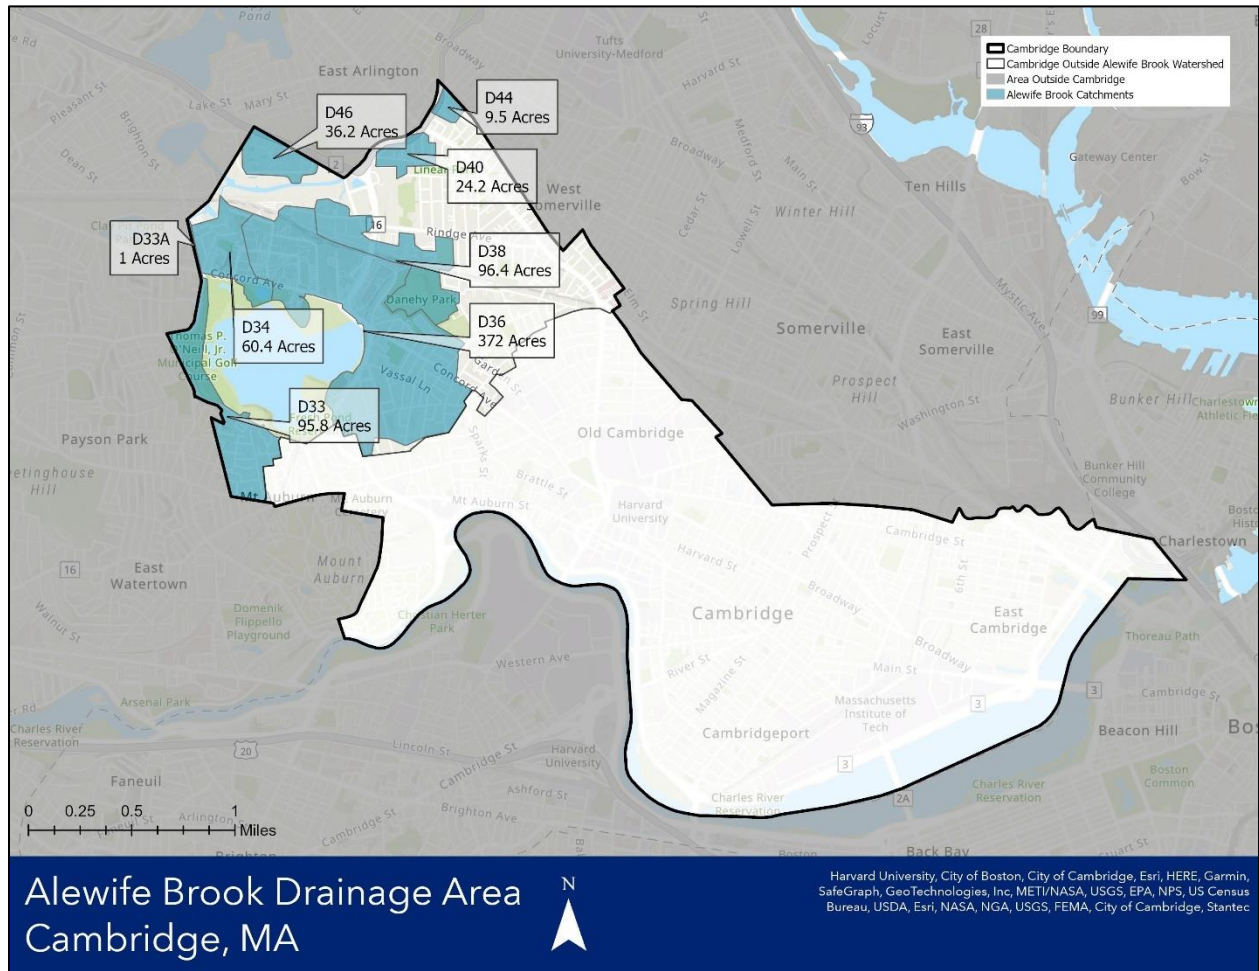

## **2 PHOSPHORUS SOURCE IDENTIFICATION REPORT**

The following sections describe the main elements of the Phosphorus Source Identification report as outlined in Appendix H of the MS4 Permit.

### **2.1 CALCULATION OF TOTAL MS4 AREA DRAINING TO IMPAIRED WATER**

Stantec has delineated the total area in Cambridge draining to the Alewife Brook, the sole tributary of the Mystic River with drainage area in Cambridge, based on topography and drainage system GIS. The analysis identified eight sub-catchments in west Cambridge which drain to Alewife Brook (Figure 1). The remaining portions of the Alewife Brook

watershed in Cambridge which are not highlighted through the subcatchments were not matched to an MS4 receiving water body (many of which are combined sewer areas).

*Figure 1: Delineated Catchments Draining to Alewife Brook*

The catchments include neighborhoods, commercial areas, and parks in west Cambridge. Specifically, the catchments include parts of the Thomas P. O'Neill Jr. Municipal golf course, Kingsley Park, and Danehy Park. They include the Fresh Pond Mall commercial center and several North Cambridge neighborhoods. In total, the catchments draining to Alewife Brook comprise approximately 695.5 acres (Table 1).

*Table 1: Cambridge MS4 Catchments Draining to Alewife Brook*

<b>Catchment Area Number</b>	<b>Catchment/Outfall Description</b>	<b>Area (Acres)</b>
D33	Blanchard @ Wellington	95.8
D33A	Blanchard Road 18"	1.0
D34	Normandy Terrance	60.4
D36	Stormwater Wetland Outlet	372.0

<b>Catchment Area Number</b>	<b>Catchment/Outfall Description</b>	<b>Area (Acres)</b>
D38	North of Cambridge Park Drive	96.4
D40	Columbus/Harrison Avenue	24.2
D44	Matignon Road	9.5
D46	Acorn Park Drive	36.2
<b>Total</b>		<b>695.5</b>

The delineated catchments make up 37.5% of all MS4 area in Cambridge and 16.7% of Cambridge’s land area. The catchments represent 1.6% of the Mystic River drainage area.

## 2.2 SCREENING AND MONITORING RESULTS

In compliance with the Year 3 MS4 permit, all MS4 outfalls within each Alewife Brook catchment were screened via field investigation and lab testing of water samples collected during dry weather in 2020 and 2021. On each sampling date, no rain had occurred in the prior 48 hours. All samples were tested for *E. Coli*, specific conductivity, total suspended solids, total phosphorus, biochemical oxygen demand, total copper, and total lead. Field inspection evaluated odor, color, turbidity, surfactants, and other conditions present at each outfall. The next sections report and summarize the total phosphorus (Total P) laboratory test results of each sample.

### 2.2.1 RESULTS

The 2020 and 2021 field investigations collected dry-weather samples from seven of the eight Alewife Brook MS4 catchment outfalls in Cambridge. The outfall corresponding to catchment D33A (Blanchard Road) was dry during both visits, so no sample could be taken. Sampling dates included August 26<sup>th</sup> and 27<sup>th</sup> 2020, May 24<sup>th</sup> 2021, and June 8<sup>th</sup> 2021. The Total P concentrations at each outfall are shown in Table 2.

*Table 2: Catchment Outfall Screening Results, 2020-2021*

<b>Catchment Area Number</b>	<b>Catchment/Outfall Description</b>	<b>Date(s) Sampled</b>	<b>Total Phosphorus (g/L)</b>
D33	Blanchard @ Wellington	8/26/2020	0.211
D33A	Blanchard Road 18"	8/26/2020, 5/24/2021	Dry
D34	Normandy Terrance	6/8/2021	0.415

Catchment Area Number	Catchment/Outfall Description	Date(s) Sampled	Total Phosphorus (g/L)
D36	Stormwater Wetland Outlet	8/27/2020	0.202
D38	North of Cambridge Park Drive	5/24/2021	0.052
D40	Columbus/Harrison Avenue	8/27/2020	0.088
D44	Matignon Road	8/27/2020	0.174
		2/16/2023	<0.001
D46	Acorn Park Drive	8/26/2020	0.222

Phosphorus concentration was highest (0.415 g/L) at the D34/Normandy Terrace outfall, which was the only outfall sampled on June 8<sup>th</sup>. Total P concentration at the D40/Columbus/Harrison Avenue outfall, sampled on August 27<sup>th</sup>, 2020, was the lowest (0.088 g/L).

**2.3 IMPERVIOUS AREA AND DCIA ESTIMATION**

Kleinfelder calculated the total impervious area and the Directly Connected Impervious Area (DCIA) in each of the eight MS4 catchments using the impervious area identified in the MassGIS 2016 Land Cover and Land Use dataset. DCIA refers to the impervious area from which runoff flows directly to drainage infrastructure rather than to pervious area where it may infiltrate into the soil. The assumed percentage of the total impervious area which drains to drainage infrastructure varies by land use. Depending on the assumed land use-specific “connectedness” between impervious areas and drainage infrastructure, different parameters are used to estimate the percentage of total impervious area. Impervious areas are assumed to have different P load rates (pounds of P exported per area per year) depending on the land use of that impervious area.

**2.3.1 RESULTS**

The land use categories found in Cambridge’s Alewife Brook MS4 catchments and corresponding connectedness categories are shown below in Table 3. The catchments contain no land uses in the “mostly disconnected” DCIA connectedness category, that is land uses from which very little runoff enters a sewer system.

Table 3: 2016 Land Use Categories in Cambridge MS4 Alewife Brook Catchments

Land Use (2016)	Connectedness Category
Commercial	Average
Industrial	Average
Mixed use, other	Average
Mixed use, primarily residential	Average
Open land	Average
Residential - multi-family	Highly connected
Residential - single family	Average
Right-of-way	Average
Tax exempt	Average
Unknown	Average

In total, the MS4 catchments contain 441.4 acres of impervious area and 332.5 acres of DCIA. The amounts and percentage of impervious area and DCIA by catchment are listed below in Table 4.

Table 4: Impervious Area, DCIA, and Estimated Total P load by Alewife Brook MS4 Catchment in Cambridge

Catchment Area Number	Catchment/Outfall Description	DCIA (acres)	DCIA PLER (lbs/year)	DCIA P Load/acre impervious/year
D33	Blanchard @ Wellington	17.40	37.30	1.29
D33A	Blanchard Road 18"	1.07	2.40	1.35
D34	Normandy Terrance	12.88	23.90	1.02
D36	Stormwater Wetland Outlet	149.59	287.20	1.40
D38	North of Cambridge Park Drive	51.22	96.20	1.56
D40	Columbus/Harrison Avenue	10.02	19.80	1.45
D44	Matignon Road	78.94	154.40	1.71
D46	Acorn Park Drive	11.40	19.90	1.22

Catchments D36, D44, and D38 contain the highest amounts of DCIA; the remaining catchments contain less than 20 acres of DCIA. The same catchments export the greatest amounts of P per year. However, the small 9.4-acre catchment D44 in North Cambridge exports the highest amount of P per acre of impervious area followed by 96.4-acre catchment D38 and 24.2-acre catchment D40, suggesting interventions treating runoff from the impervious area in these catchments could be especially effective in reducing P input to Alewife Brook.

## **2.4 CATCHMENT PRIORITIZATION**

The Mystic River Alternative TMDL recommends an ambitious 67% reduction in total P inputs aggregated across the Mystic River Watershed to achieve water quality targets. To achieve these reductions across the watershed in a cost-effective way, it is necessary to prioritize P reduction interventions where they will be most cost-effective. Based on the outfall screening results and estimated total P loads from DCIAs in each Alewife Brook MS4 catchment in Cambridge, Kleinfelder recommends in the next section catchments where P reduction interventions are likely to most effectively reduce total P concentration in stormwater.

### **2.4.1 METHODS**

Catchments where total P stormwater interventions will have the greatest P reduction impact will have a high concentration of total P in stormwater runoff. One indicator of high-P runoff is the estimated total P load per acre of impervious area in the watershed, reported in Section 2.3. This indicator points to catchments where stormwater interception and treatment onsite is most likely to treat impervious runoff which is high in total P. Another indicator is empirical measurements of total P concentration in stormwater sampled from each catchment outfall (shown in section 2.2). Empirical measurements in total P concentration at outfalls reflect actual conditions stemming from total P in runoff directly from impervious surfaces as well as other drainage conditions and connectivity within the watershed. Both measures point to the potential for high total P inputs to receiving waters from the catchment and a greater need to both treat stormwater for total P reduction and investigate catchment conditions to identify specific sources of P in the catchment.

Kleinfelder prioritizes Cambridge's Alewife Brook MS4 catchments based on both factors. To do this, both estimated total P load per impervious acre and empirical P concentration measurements at each catchment outfall are normalized from 0 – 1 where "0" is the lowest value of the indicator across the catchments, "1" is the highest value of the indicator across the catchments, and "0.5" is a value halfway between the highest and lowest values of the indicator across the catchments. The 0 – 1 normalized values of total DCIA P load per acre of impervious area and measured total P concentration are then added together to produce a prioritization score for each catchment.

### **2.4.2 RESULTS**

Based on this planning-level catchment prioritization, the Matignon Road (D44), Normandy Terrace (D34), and Stormwater Wetland Outlet (D36) catchments should be the highest priority for total P reduction and investigation within Cambridge's Alewife Brook catchments (Table 5). Phosphorus release from decaying vegetation in stormwater wetlands is variable and determinants of P sequestration and release are multifactorial, so it is possible that the high P concentration found in discharge from the Alewife Brook

Stormwater could be driven by the P concentration of water inputs to the system, from decaying wetland vegetation, or a combination of both factors.<sup>1,2</sup>

Table 5: Normalized Catchment Prioritization Score

Catchment Area Number	Catchment Description	Normalized Estimated P load per impervious acre per year	Normalized laboratory TP concentration	Prioritization Score (Sum)
D33	Blanchard @ Wellington	0.39	0.44	0.83
D33A	Blanchard Road 18"	0.48	-	0.48
D34	Normandy Terrace	0.00	1.00	1.00
D36	Stormwater Wetland Outlet	0.55	0.41	0.96
D38	North of Cambridge Park Drive	0.78	0.00	0.78
D40	Columbus/Harrison Avenue	0.62	0.10	0.72
D44	Matignon Road	1.00	0.34	1.34
D46	Acorn Park Drive	0.29	0.47	0.76

The Matignon Road catchment had the highest estimated total P load from DCIA per impervious acre, though the measured total P concentration from the field sampling was relatively low. In contrast, the Normandy Terrace catchment had the highest sampled total P concentration but the lowest estimated DCIA total P load per impervious acre in the catchment. The Stormwater Wetland Outlet catchment had moderate values of both indicators relative to the other catchments.

## 2.5 IDENTIFICATION OF BMP RETROFIT OPPORTUNITIES

This section contains an initial structural stormwater best management practice (BMP) suitability assessment (i.e. areas physically suitable for BMP installation) of pervious land area within the Alewife Brook MS4 catchments within Cambridge and a review of the City's near-term capital projects to identify synergies and realize cost savings through the implementation of multi-benefit projects.

Kleinfelder first conducted a GIS-based desktop screening analysis to identify potential areas for reducing P export in the Alewife Brook watershed with structural stormwater BMPs on the sub-parcel level in two ways:

<sup>1</sup> Cheesman et al. (2010). "Phosphorus Transformations during Decomposition of Wetland Macrophytes." *Environmental Science and Technology* Vol. 44, pp. 9265 – 9271.

<sup>2</sup> Zhang et al. (2018). "Phosphorus transformations at the sediment-water interface in shallow freshwater ecosystems caused by decomposition of plant debris." *Chemosphere* Vol. 201, pp. 328 – 334.

1. Identifying suitable sites for structural stormwater BMPs on un-built, pervious areas not already occupied by impervious cover, and
2. Identifying city-owned paved areas in Cambridge's Alewife Brook MS4 catchments which could be used for structural BMPs.

Under the first analysis of BMP suitability on pervious sites, parcels and parts of parcels (hereafter "sites") which are not MS4 catchments, overlap MassDEP wetlands or priority habitat, have impervious land cover, and sites on parcels which contain less than 300 sf pervious area are excluded from the analysis other than Cambridge parcels. All privately-owned sites on parcels with less than 300 sf pervious area are excluded because a small area of non-impervious open space is unlikely to be ceded by owners for stormwater management purposes unless incentivized. We identify City-owned paved areas where pavement could be removed and replaced to allow construction of a structural stormwater BMP in a separate analysis.

Pervious sites' BMP suitability is summarized through a ranking process that quantitatively evaluates where in the Alewife Brook drainage area structural stormwater BMPs are most appropriate based on physical site characteristics categorizes each eligible site as either 'good,' 'fair,' or 'poor'. We first rank all eligible sites on Cambridge parcels in the Alewife Brook MS4 catchments, then identify highly ranked BMP opportunities that are on City-owned parcels. Because the Mystic River TMDL recommends pursuing stormwater BMPs on properties that are not municipally-owned to achieve the recommended P reduction target, we also identify several highly ranked pervious BMP opportunities in Alewife Book MS4 catchments that are on large tax-exempt and commercial parcels.

In section 2.5.3 we should that fifty-six percent of Cambridge parcels in the Alewife Brook MS4 catchments received a primary ranking of either 'good' or 'fair' for structural BMP retrofits on pervious areas; in addition, 60% of parcels contain pervious sub-areas ranked 'good' for BMP siting even if the parcel as a whole received another rating based on the greatest area on the parcel with each rating. In section 2.5.3.1 we show that of the 'good' and 'fair' parcels, 16 are publicly owned and several are co-located with planned street, sidewalk, and sewer and drainage improvements identified in the City's capital planning initiatives. We also identify 26 City-owned parcels which contain paved areas potentially suitable for subsurface stormwater BMPs. Section 2.5.3.1 presents the estimated stormwater treatment performance potential of the stormwater BMPs if installed on pervious areas of the suitable City-owned parcels and determined structural stormwater BMP retrofits on pervious areas could result in an estimated P reduction of 32.01 lb/yr, or 56% of the total estimated P load from any land cover on the same set of City-owned parcels which approaches the 67% TP load reduction set in the Mystic River Alternative TMDL.<sup>3</sup> This is a conservative, planning-level estimate for implementing structural BMPs on suitable City-owned properties to inform future stormwater P mitigation.

The BMP suitability analysis determined that while Cambridge's diverse land use characteristics within the Alewife Brook drainage area contain sites conducive to parcel-

---

<sup>3</sup> <https://www.epa.gov/mysticriver/environmental-challenges-mystic-river-watershed#NutrientChallenges>

based stormwater management, site-specific physical constraints such as limited pervious area can limit opportunities. Unknown soil drainage characteristics across much of the City add further uncertainty to the BMP suitability assessment of pervious areas. While structural BMPs may be more resource-intensive and logistically challenging to install on paved areas, Cambridge's Alewife Brook MS4 catchments contain numerous City-owned paved areas which could potentially host underground stormwater BMPs. Implementation of structural stormwater BMPs on suitable City-owned parcels is estimated to provide moderate reduction benefits.

## 2.5.2 BMP SUITABILITY ANALYSIS

Kleinfelder conducted a GIS-based desktop screening analysis to identify potential areas for reducing P export with structural stormwater BMPs on the parcel level, within the parts of the City of Cambridge which drain to Alewife Brook. The goal of this planning-level analysis is to identify parcels that bring the highest value to the City (in terms of P reduction, stormwater volume reduction, community benefit, etc.). Ideal project locations will be near impervious surfaces (which export a higher amount of P than pervious surfaces) with low slope, well-draining soils, and enough open space to install structural BMPs.

## 2.5.3 METHODS

### 2.5.3.1 Suitability assessment of pervious areas for structural BMPs

To identify parcels with impervious area that have space and favorable site conditions for BMP implementation on pervious parts of the parcel, the analysis utilized a ranking process that quantitatively evaluated where structural stormwater BMPs are most appropriate, based on these physical site characteristics:

- Hydrologic Soil Group (HSG)<sup>4</sup>
- Slope<sup>5</sup>
- Impervious area

Each parcel was processed through a workflow that assigned a rating (good, fair, or poor) to each pervious part of the parcel with a unique combination of HSG and slope category (hereafter, "sites") as derived from the GIS analysis (Figure 2). Highly permeable soils and low slopes are optimal (i.e. more cost-effective) for structural BMP implementation. Managing stormwater on highly impervious parcels will offer the highest P reduction benefit. Sites with dual HSG classification are assigned the primary HSG class as recommended by MassDEP<sup>6</sup>. Kleinfelder sourced impervious surface data from the 2016 Land Use and Land Cover dataset prepared by MassGIS<sup>7</sup>. In order to

---

<sup>4</sup> <https://www.mass.gov/info-details/massgis-data-soils-ssurgo-certified-nrcs>

<sup>5</sup> <https://www.mass.gov/info-details/massgis-data-elevation-topographic-data-2005>

<sup>6</sup> <https://www.mass.gov/doc/2016-massachusetts-small-ms4-permit-pollutant-loading-export-rates/download>

<sup>7</sup> <https://www.mass.gov/info-details/massgis-data-2016-land-coverland-use>

determine a ranking that summarizes sites' BMP suitability rating across all three characteristics the following logic was applied:

- Poor = any site where any of the three factors is rated 'poor'
- Fair = any site where any two of the three factors are rated 'fair' or better
- Good = any site where any two of the three factors are rated 'good'
- Unknown = any site where data were insufficient to make a determination, i.e. at least one of the three factors is unknown and none of the factors are rated 'poor.'

Figure 2: BMP Suitability Workflow

In order to determine whether there was sufficient open area for structural BMP implementation (300 sf<sup>8</sup>), the total area of impervious surface, wetlands<sup>9</sup>, and priority

<sup>8</sup> Per the methodology of the Resilient Cambridge Plan (<https://www.cambridgema.gov/Departments/CommunityDevelopment/ResilientCambridgePlan>)

<sup>9</sup> <https://www.mass.gov/info-details/massgis-data-massdep-wetlands-2005>

habitat<sup>10</sup> are excluded from the area considered eligible for structural BMPs. Sites that had less than 300 sf of remaining eligible pervious area were removed from the analysis due to likely owner resistance of ceding that small amount of open space entirely to use as a structural stormwater BMP. Here, “pervious area” refers to any part of the parcel which is not covered by an impervious land use such as building, pavement, or parking lot. BMP opportunities on paved areas are analyzed separately because suitability considerations are different on sites which are already paved.

In addition to ranking each eligible BMP site within parcels, parcels as a whole were also assigned an overall rank and overall rating of each individual characteristic based on which rank or rating other than “Unknown” occupied the greatest pervious area on the parcel. The distinctions between a “site” within a parcel, a parcel, and how a site vs. a parcel is rated are illustrated below in Figure 3.

Figure 3: Parcel host to 250 Fresh Pond Parkway (left); pervious sites present on 250 Fresh Pond Parkway (right).

The area contained by the Cambridge parcel with the address 250 Fresh Pond Parkway is shown on the left panel of Figure 3. The portions of the green parcel overlaid by the translucent polygon are outside the Alewife Brook MS4 catchment areas and are therefore not eligible for BMP consideration in this analysis. The highlighted areas in the right-side panel of Figure 3 show the pervious sites by associated BMP suitability ranking on the 250 Fresh Pond Parkway parcel. Most eligible area on the parcel is ranked “Good” (symbolized by deep green coloring) thus the parcel’s primary ranking is “Good” suitability for structural BMPs.

Figure 4 illustrates the ranking of the sites at the lower left side of the 250 Fresh Pond Parkway shown in Figure 3. Two sites are ranked “Good” suitability for structural BMPs because the parcel contains a large amount of impervious area (10.3 acres), the sites have “Fair” HSG (B), and “Good” (shallow) slopes. Two other sites are ranked “Poor”

<sup>10</sup> <https://www.mass.gov/info-details/massgis-data-nhosp-priority-habitats-of-rare-species>

because, while the parcel has a large amount of impervious area and “Fair” (B) HSG, those particular sites have steep (“Poor”) slopes.

The remaining two sites, shown in grey, are ranked “Unknown.” Both sites have “Good” slope and impervious surface ratings, but there is no information is available on the HSG at the sites. The two “Good” ratings at the sites would be sufficient to earn a “Good” overall ranking if the HSG rating were (a) known and (b) rated “Fair” or “Good.” However, if HSG at the sites were known and rated “Poor”, the site would be ranked “Poor” overall even though the first two suitability factors were rated “Good.”

As the above example illustrates, sites at which one of the three rating factors is unknown are rated “Unknown” unless another of the factors at the site is rated “Poor” because any site at which any of the suitability factors is rated “Poor” is ranked “Poor” for overall BMP suitability. Even if two suitability factors are rated “Fair” or “Good” and the remaining factor is rated “Unknown”, the site’s overall BMP suitability ranking will be “Unknown” because the factor for which no rating information is available could turn out to be rated “Poor”, thus altering the “Good” or “Fair” overall BMP suitability rating the site would otherwise earn.

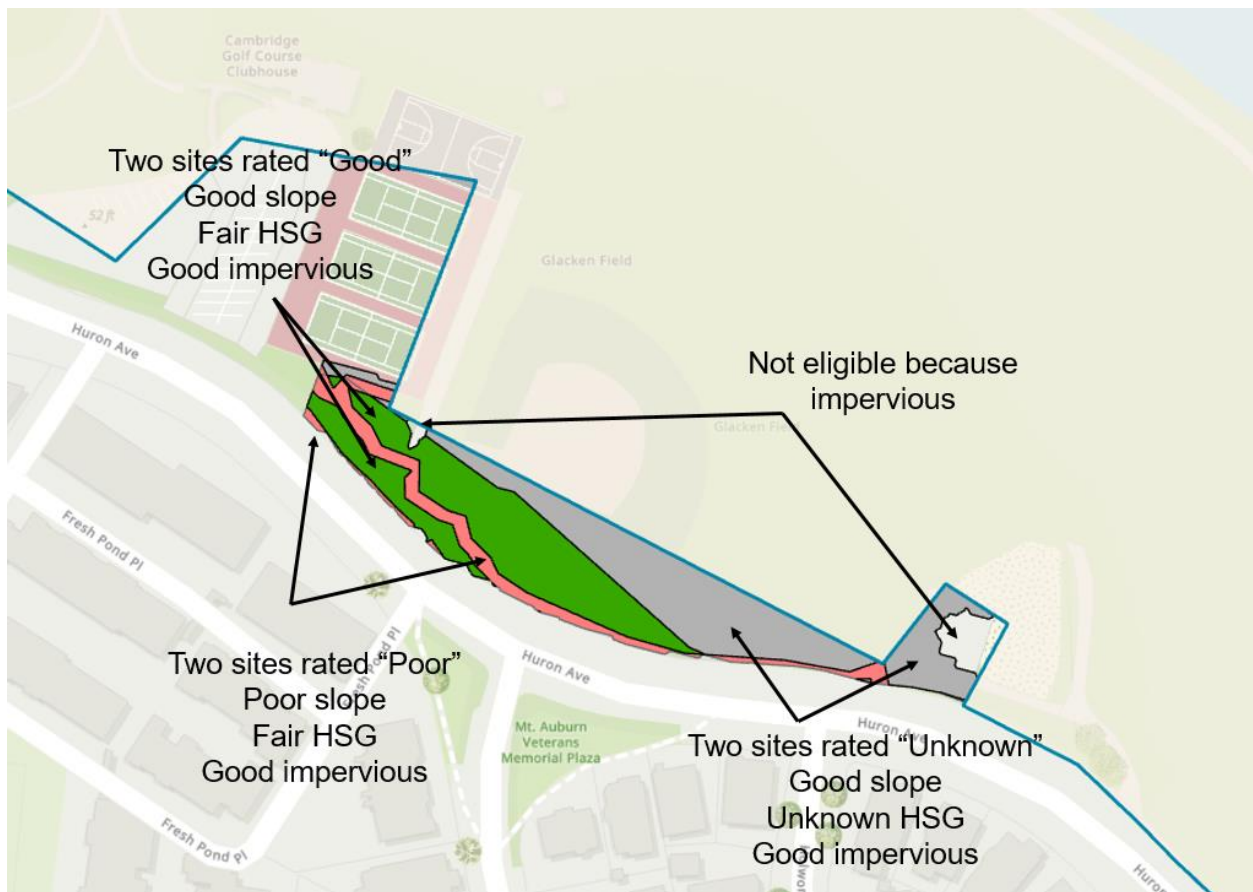

Figure 4: Detail illustrating characteristics of six sites within the 250 Fresh Pond Parkway parcel.

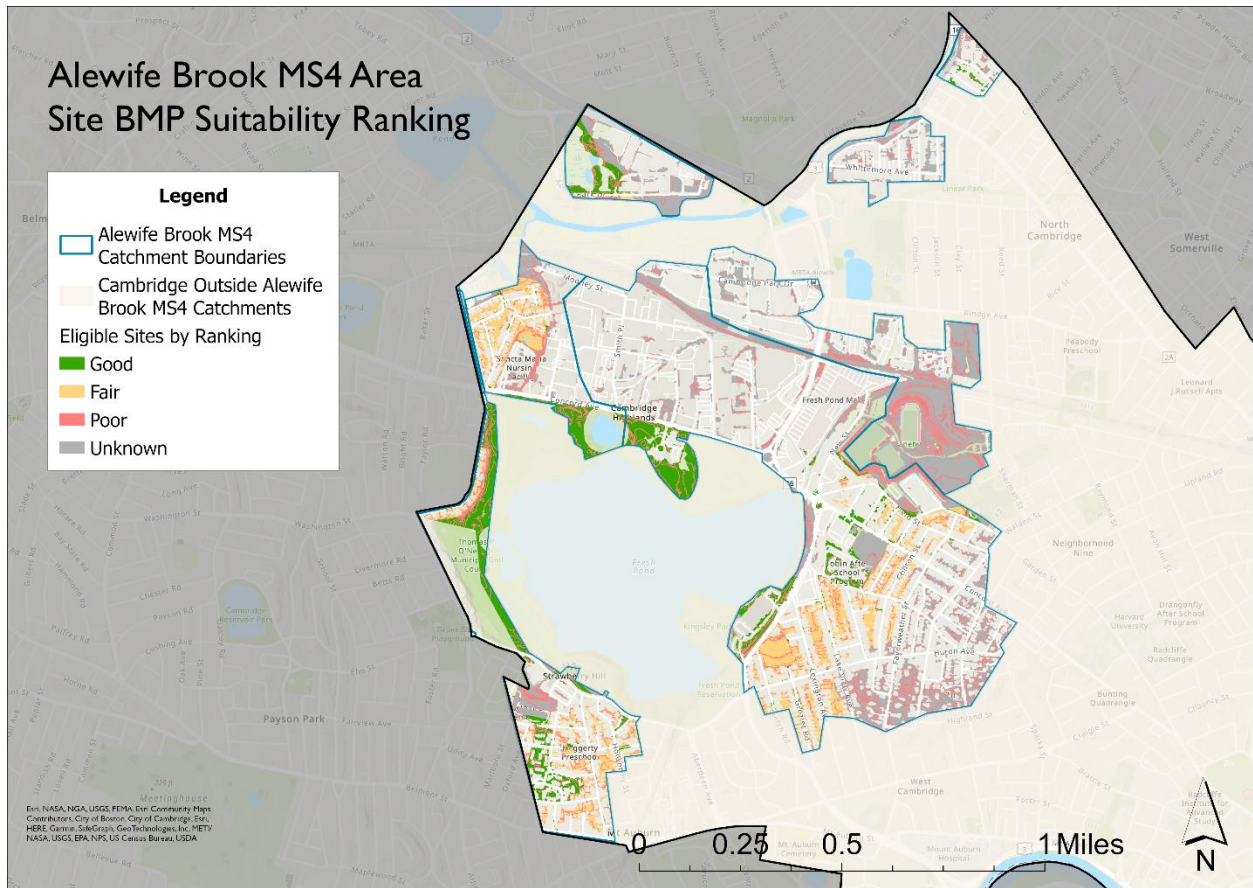

The methods described above produced an inventory of private and public pervious sites with favorable physical site conditions and sufficient available open space that could most readily be retrofitted to manage stormwater and mitigate P.

#### 2.5.3.2 Suitability assessment of paved areas for structural BMPs

To ensure that potentially viable siting options on City-owned, sub-300sf pervious area parcels are not omitted from the analysis, options for installing structural BMPs under paved surfaces were analyzed. Paved areas in Cambridge's MS4 catchments were identified through the MassGIS Land Cover and Land Use dataset produced in 2016<sup>7</sup> and the City of Cambridge' GIS data delineating sidewalks, public footpaths, private walkways, plazas, parking lots, and driveways. Sites covered by existing buildings were not considered as potential subsurface BMP sites. Also excluded were areas which already host underground stormwater BMP structures according to the City's GIS data.

### 2.5.4 RESULTS

Cambridge's Alewife Brook MS4 catchments contain or overlap with 1664 parcels, of which 1428 (86%) contain over 300 sf of pervious, eligible area. Kleinfelder ranked sites on the 1428 parcels with at least 300 contiguous sf of functional pervious area (i.e. not wetland or priority habitat) in Cambridge's MS4 catchments to determine the most feasible and optimal locations for future structural stormwater BMPs. Adjacent sites on the parcel with different HSG or slope ratings were considered together when determining whether BMP opportunities at least 300 sf in area are available on the parcel. Figure 5 depicts the qualitative suitability rating of 'unknown,' 'poor,' 'fair,' or 'good' of sites within each parcel based on the site characteristics described above. Sites are rated "unknown" when one or more rating factor cannot provide information at the site location such that a rating cannot be determined (see section 2.5.2 for further detail on how a rating is made). A full list of all eligible City parcels which drain to Alewife Brook with the associated BMP suitability analysis is included in Appendix A.

*Figure 5: BMP Suitability Analysis Results*

Almost half (48%) of the parcels contain contiguous pervious sites of at least 300 square feet which have either ‘good’ or ‘fair’ BMP suitability rankings. When parcels as a whole are categorized in terms of the ranking of the greatest area present on the parcel ranked “Unknown”, only 3% of parcels are dominated by “Good” BMP suitability areas, 53% are dominated by “Fair” suitability areas, and 39% contain primarily “Poor” suitability area (Figure 8, ). Six percent of parcels did not contain any area for which a ranking could be made and were classified as ‘Unknown.’

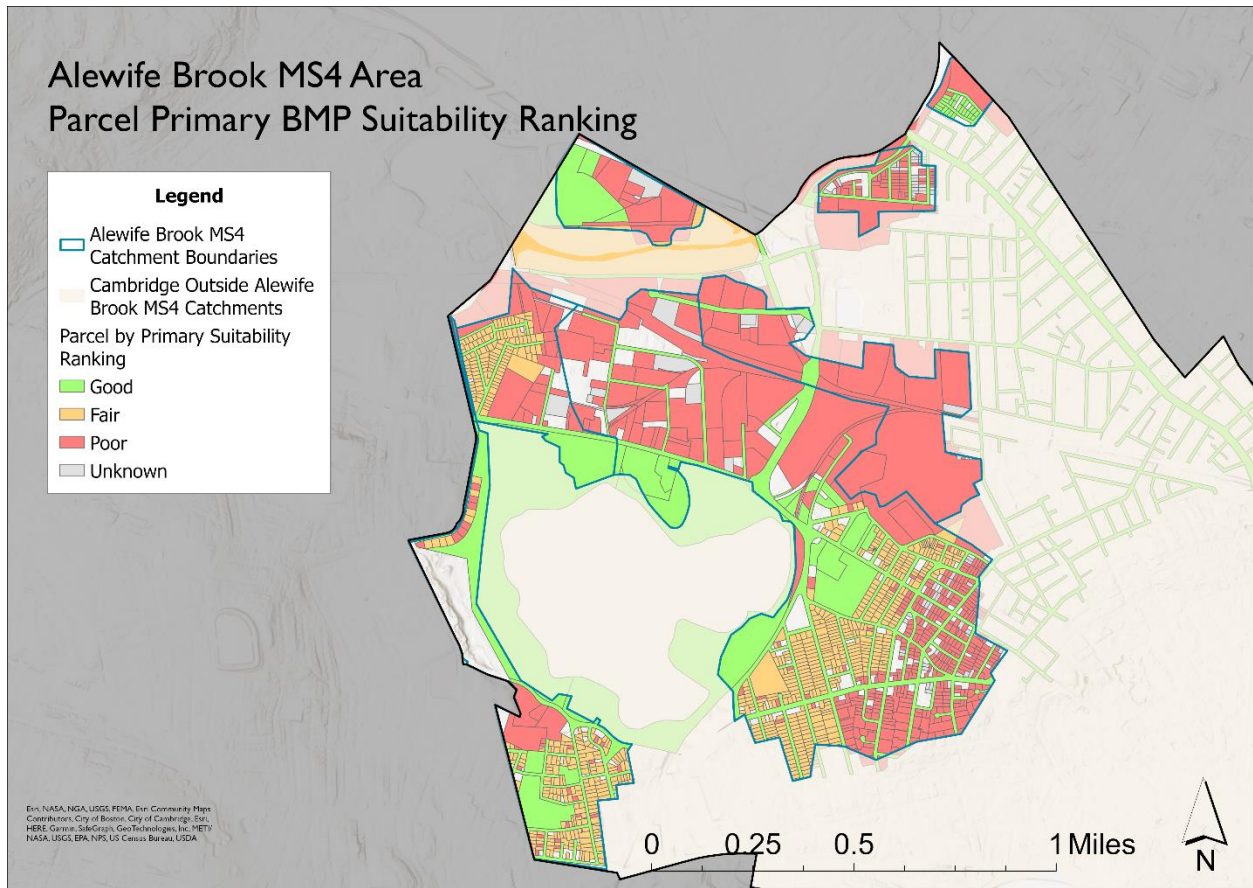

Figure 6: Alewife Brook Parcels by Primary Ranking

Many parcels and sites within parcels could not be ranked because HSG information is not currently available at the parcel (Table 6). Finally, the minimum threshold of 300 sf of functional pervious area (i.e. not wetland or priority habitat) excluded 236 parcels from the analysis of the pervious sites (that is, 236 parcels did not contain any sites which comprised 300 sf or more of contiguous eligible area). While most of these parcels were excluded because they are dominated by impervious land cover, wetlands, and priority habitat areas are also represented in the parts of Cambridge which drain to Alewife Brook.

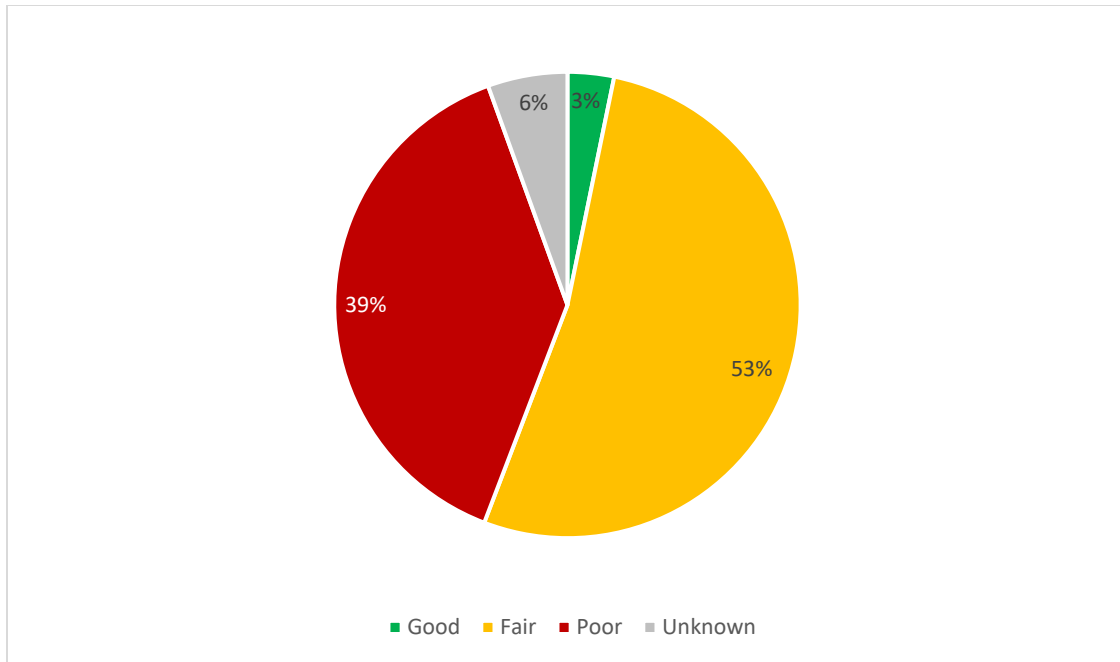

Figure 7. Parcels by Primary BMP Suitability Rating

Table 6: Summary of Parcel BMP Suitability Rating by Greatest Area\*

Primary Site Rating (Greatest Area)	Number of Parcels				
	Good	Fair	Poor	Unknown	Total
<b>Overall</b>	46	751	552	79	1428
<b>Soil (HSG)</b>	30	841	0	557	1428
<b>Slope</b>	1327	0	101	0	1428
<b>Impervious Area</b>	110	1313	0	5	1428

\*Note: Ranking by site characteristic rating which occupies the greatest area on the parcel which is not rated 'unknown' for that characteristic. 'Unknown' indicates every part of the parcel has an unknown rating.

The analysis of paved sites yielded 26 parcels that are owned by the City of Cambridge which contained paved land cover areas not already used for subsurface stormwater BMPs. Paved land uses on the sites include sidewalk, private walkway, public footpath, parking lot, driveway, and plaza.

#### 2.5.4.1 Highly-Rated City-Owned Parcels

This BMP suitability analysis finds that eight hundred and twenty-four Cambridge parcels in Alewife Brook MS4 catchments contain at least 300 square feet of "good" and "fair"-ranked BMP suitability opportunities. Of the 824 parcels, 16 are publicly owned (Table 7). In order to derive a planning-level estimate of the potential P reductions that could be

achieved if the implementation of structural stormwater BMPs at these publicly owned parcels was advanced, the project team estimated performance using the P loading rates and structural BMP performance curves provided in the MS4 Permit Appendix F<sup>11</sup> and the guidance provided by MassDEP for estimating P loads based on 2016 land use and land cover. Phosphorus load reduction rates are calculated using the following equation:

$$P \text{ Reduction} = (\text{Impervious Area}) * (\text{P Export Rate}) * (\text{BMP Performance})$$

Where:

Variable	Definition	Value	Units
Impervious Area	Assume 70% of total impervious area on each City-owned 'good' and 'fair' parcels within Alewife Brook drainage area could be managed by structural BMPs.	22.23	ac
P Export Rate	Blended P export rate by impervious land use calculated for City-owned parcels in Alewife Brook drainage area per MassDEP guidance for 2016 Land Cover and Land Use dataset	1.8	lb/ac/yr
BMP Performance	Assumed relatively conservative estimate	80	%

Given the assumptions above, implementing structural BMPs on suitable City-owned parcels would result in an estimated P reduction of 32.01 lb/yr. This is a conservative, planning-level estimate for implementing structural stormwater BMPs on suitable City-owned properties. It should be noted that there are likely more structural BMP opportunities on parcels for sub-surface BMPs or hardscape BMPs such as permeable pavement. Also, the BMP suitability analysis de-prioritized large pervious parcels with minimal imperviousness because there will be little runoff from the small impervious areas running directly into storm sewers, then receiving waters. These parcels may be well suited for regional-scale projects that could manage stormwater runoff from nearby impervious areas such as roads or parking lots.

<sup>11</sup> <https://www3.epa.gov/region1/npdes/stormwater/ma/2016fpd/appendix-f-2016-ma-sms4-gp-mod.pdf>

Table 7: Publicly-Owned 'Good' and 'Fair' Pervious Area Parcels

The analysis also yielded 26 City-owned parcels which might be used for subsurface structural BMPs (Table 8).

### *Synergies with Related BMP Studies*

Several City-owned parcels have been identified as highly suitable for BMPs in the Cambridge-MS4 Services Task 5D BMP retrofit opportunities technical memorandum:

- Tobin School recreational areas (189 Vassal Lane)
  - The parcel is located in MS4 catchment D36.
- 250 Fresh Pond Parkway/Fresh Pond Reservation Adjacent Cushing Street Plaza
  - This large parcel that surrounds the eastern half of Fresh Pond overlaps slightly with MS4 catchment D33. The southern arm of the parcel also overlaps the Cushing Street Plaza area identified in Task 5D. The parcel is highly rated for stormwater BMP suitability and the City has already installed several onsite. The portion of the parcel which overlaps Cushing Street Plaza could be used to treat runoff from adjacent impervious areas. Potential BMP siting and design on this parcel should account for the location's status as a Public Water System protected area.

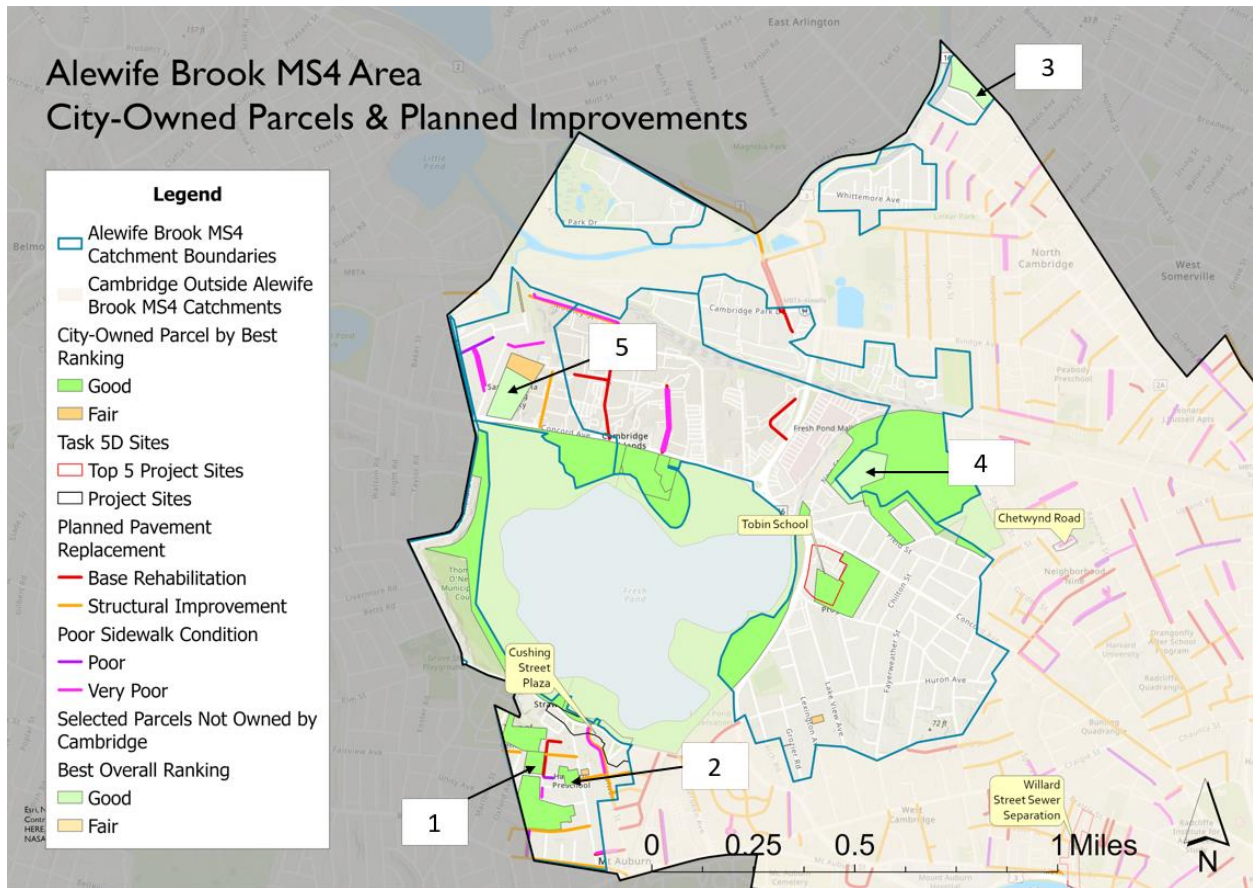

Figure 8: Highly-Ranked City-Owned Parcels and Task 5D Project Sites

### Synergies with Planned Construction

The City’s progressive stormwater management strategy includes regulations and design guidelines to allow the construction of green infrastructure. The City also developed a Five-year Sidewalk and Street Reconstruction Plan that includes opportunities for stormwater management and developed a Ten-Year Sewer and Drain Infrastructure Plan which describes the City’s upcoming capital and maintenance program for these systems.

In this section, we identify City-owned sites with high BMP suitability that coincide with high-priority areas for sidewalk and street reconstruction as well as planned sewer and drain improvements. Parcels in or very near areas where work is planned can be future candidates for BMP retrofit development as the City invests in the implementation of sidewalk and drainage priority improvements in parallel.

City-owned parcels which contain a minimum of 300 sf of “good” or “fair” ranked BMP site opportunities coincide with several priority areas identified in the 10-year Sewer and Drain Infrastructure Plan, 5-year plan prioritizing upgrades to streets and sidewalks (Figure ).

We list these opportunities below.

- **[1] Cushing Court, Cambridge Housing Authority**
  - This parcel adjacent to May Street includes over 228,000 sf rated “Good” for stormwater BMPs. The segment of May Street abutting Cushing Court/Cushing Plaza to the east is scheduled for base rehabilitation in Cambridge’s Five-year Sidewalk and Street Reconstruction Plan. Chapter 90 upgrades to this area are currently under bid and should be complete by 2023. The parcel is located in MS4 drainage area D33.
- **[2] 116 Cushing Street (Haggerty Preschool)**
  - This parcel is across Cushing Street from the intersection with Locust Street, which is scheduled for structural improvements in the Five-year Sidewalk and Street Reconstruction Plan. The parcel is publicly owned and contains almost 4,000 sf of area ranked “Good” for BMP suitability. 116 Cushing Street is located in MS4 drainage area D33.

#### 2.5.4.2 Highly-Rated Parcels Not Owned by City of Cambridge

The Mystic River Alternative TMDL acknowledges that stormwater mitigation on municipal properties must be augmented with stormwater BMPs on private property to meet the 60% Phosphorus reduction goal. To that end, we identify several privately owned parcels with high BMP suitability and advantageous location for Phosphorus reduction.

- **[3] 41 – 45 Alewife Brook Parkway: St. Sava Serbian Orthodox Church (loc F\_755217\_2971995)**
  - Though more area on the parcel is rated “poor” than “good” or “fair”, the parcel contains 439 sf of highly rated BMP opportunities on pervious area bordering the parcel. The parcel is situated in MS4 catchment D44 which has a high estimated P export rate. The community-centered property owner may be amenable to installing a stormwater BMP as a service and educational opportunity.
- **[4] 66 New Street: Danehy Park Fields (loc F\_753802\_2966903)**
  - This parcel is owned by the Commonwealth of Massachusetts. However, like the Cambridge-owned remainder of Danehy Park, this parcel is highly rated for stormwater BMPs outside the fields themselves. It is within MS4 catchment D36.
- **[5] 795 Concord Avenue: Sancta Maria Nursing Facility (loc F\_749235\_2967949/2074317)**
  - The hospital grounds contain 1093 sf of eligible space which is ranked “good” for BMP suitability. The hospital is in MS4 catchment D34.

### 3 YEAR 5 UPDATE – POTENTIAL STRUCTURAL BMPS

Based on the analysis completed in Year 4, the City’s planned projects, and the ability to incorporate structural BMPs, the City identified the following five projects for installation of potential structural BMPs within the Mystic River Watershed in Cambridge (Figure ).

Figure 9: Selected City Projects for Structural BMPs

### **Huron Avenue and Cushing Plaza Improvements Project:**

Huron Avenue from Fresh Pond Lane to Fresh Pond Parkway is scheduled for reconstruction as part of the City's Five-Year Street and Sidewalk Reconstruction Plan. Cushing Plaza, located within the project area at Cushing Street and Huron Avenue, is being reconstructed to allow stormwater to infiltrate and provide enhanced tree and garden planting areas. This project includes impervious cover reduction of 3,750 square feet and is scheduled to be completed in Fall 2023.

### **Tobin Montessori and Vassal Lane Upper Schools Project:**

This project provides new facilities for Tobin Montessori School, Vassal Lane Upper School, Special Start and Department of Human Services Programs preschool and after school programs. The project is also addressing street flooding in the neighborhood with the installation of a 1.5 million gallon underground stormwater tank on-site. Beyond these large improvements, the City is also including a bioretention rain garden designed to treat 100,000 gallons of stormwater. This project is scheduled to be completed in December 2024.

### **Park Avenue Road Reconstruction Project:**

Park Avenue from Huron Avenue to Holworthy Street, is being reconstructed as part of the City's Five-Year Street and Sidewalk Reconstruction Plan. The roadway will be reconstructed to improve drainage, make sidewalks more accessible for all users, add trees and green infrastructure and make the street safe for all users. The project includes three (3) bioretention curb extension planters and will be completed in Fall 2023.

### **Danehy Gateway Pavilion Park Project:**

This project is a collaboration between the Cambridge Department of Public Works and the Department of Human Service Programs Recreation Division for the construction of a new sports pavilion. The pavilion and adjacent parking lot will include two underground detention systems made up of 196 StormTech infiltration chambers, porous pavement, and several bioretention areas. This project is currently still in design, so the exact size and number of structural BMPs is not finalized. This project is anticipated to be constructed by 2028.

### **Alewife Linear Park Restoration Project:**

The Cambridge Forestry Department proposed this restoration project to address the City's decline in tree canopy. The project will include the development of additional tree canopy and soil remediation and enhancement, and will evaluate opportunities for stormwater BMPs. This is a phased project and the final phase is anticipated to be complete by 2028.

### 3.1 ESTIMATED COSTS AND TIMELINE

The City estimated the approximate construction cost of the individual BMPs (Table 8). In the Case of Danehy Pavilion Park, the project is still in design and the estimated costs are planning level only. Costs were estimated in 2023 dollars using many sources including the University of New Hampshire Stormwater Center Stormwater Calculator, the Minnesota Stormwater Manual, the Maryland Department of the Environment Stormwater BMP Unit Cost Calculator, vendor quotes, and current construction cost estimates.

*Table 8: Estimated Project Costs*

<b>Project</b>	<b>Structural BMP</b>	<b>Construction Cost</b>	<b>Schedule</b>
Huron Avenue & Cushing Plaza Improvement	Impervious Cover Reduction	\$12,100	Fall 2023
Tobin School	Bioretention Rain Garden (100,000 gallons)	\$310,000	December 2024
Park Avenue	3 - Bioretention Curb Extension Planters	\$145,500	Fall 2023
Danehy Pavilion Park	Underground Detention System (180 SC-740 and 16 SC-310 chambers)	\$173,200	2028
	Porous Pavement	\$20,000	
	Bioretention Rain Gardens	\$48,500	
Alewife Linear Park Restoration Project	Urban Tree Planting and Soil Enhancement	\$48,200	2028

### 3.2 DEMONSTRATION PROJECT

The City must install at least one structural BMP as a demonstration project by 2024. The City plans to use the Huron Avenue and Cushing Plaza Improvement Project as their demonstration project. The City will list this as their demonstration project in the Annual Report and promote the project once it is constructed.

### **3.3 FUTURE TRACKING**

The City will track newly installed structural BMPs in the regulated area and estimate the phosphorus removal by each using EPA's methodology included in Attachment 3 to Appendix F. The City will document the BMP type, the total area treated by the BMP, the design storage volume of the BMP, and the estimated phosphorus removed in mass per year by the BMP in annual reports moving forward.

## **4 SUMMARY**

Cambridge contains eight MS4 sub-catchments comprising almost 700 acres, or 16.7% of Cambridge's total area, which drain to the Alewife Brook. These 700 acres comprise 1.44% of the Mystic River Watershed and Kleinfelder estimated P load based on the latest available land use and land cover data within each sub-catchment and reviewed screening and monitoring results at catchment outfalls to determine which of the catchments should be considered the highest priority for stormwater P reduction. Based on those indicators, the Matignon Road (D44), Normandy Terrace (D34), and Stormwater Wetland Outlet (D36) catchments should be the highest priority for P reduction overall. Specifically, the Matignon Road catchment should be a high priority for on-site stormwater mitigation due to the prevalence of land use and cover with a high estimated P load per area. The Normandy Terrace catchment should be a high priority for illicit discharge and connection screening as well as on-site stormwater mitigation based on the high total P concentration found via laboratory testing.

Kleinfelder analyzed all pervious Cambridge area which is not wetland or priority habitat in the Alewife Brook MS4 catchments for structural BMP suitability based on a low slope, high soil permeability, and high on-site impervious area. Almost half (48%) of the parcels contain contiguous sites of at least 300 square feet which have either 'good' or 'fair' BMP suitability rankings. Six percent of parcels did not contain any area for which a suitability ranking could be determined either because the soil data were missing at the parcel or because the parcel did not contain any eligible area on which a BMP could be installed. Kleinfelder identified sixteen parcels owned by the City on which the greatest proportion of ranked area was rated "fair" or "good" and three non-City owned parcels that contained highly-rated potential BMP sites. Two of the highly ranked City-owned parcels overlap with high-priority BMP project sites identified in Task 5D; another overlaps or adjacent to a right-of-ways identified for street and-or sidewalk reconstruction in the City's 5-Year Sidewalk and Street Reconstruction Plan.

The sites identified in Year 4 provided a range of opportunities primarily within Cambridge's Alewife Brook MS4 catchments to reduce P runoff into Alewife Brook and the Mystic River Watershed through structural stormwater BMPs; the P load estimates and outfall testing results provide direction for the most efficient steps the City can take to reduce P load throughout the watershed.

Based on the analysis completed in Year 4, the City selected five projects and included structural BMPs to address Permit Year 5 requirements. These five projects will be completed in the next five years and one, Huron Ave and Cushing Plaza will be used as a demonstration project. The City estimated construction costs for the structural BMPs and once installed, will track and report on them in subsequent Annual Reports.

**APPENDIX A**

# Appendix A1: Parcel Summary
